# Part 1

Welcome to PRTG Network Monitor

# 1 Welcome to PRTG Network Monitor

Welcome to PRTG Network Monitor! You have chosen an easy-to-use software product that comes with a powerful set of features to monitor your entire network.

## Why Network Monitoring is Important

Today, most businesses rely on a computer and network infrastructure for internet, internal management, telephone, and email. A complex set of servers and network equipment is required to ensure that business data flows seamlessly between employees, offices, and customers. The economical success of an organization is tightly connected with the flow of data.

The computer network's reliability, speed, and efficiency are crucial for businesses to be successful. But, like all other technical objects, network devices may fail from time to time—potentially causing trouble and loss of sales, no matter what migration efforts have been made up-front.

Network administrators need to take three key steps to maintain network uptime, reliability, and speed:

1. Set up a well-planned network with reliable components.
2. Create recovery plans for the event of device failure.
3. Monitor their network to know about failures as they build up or actually happen.

PRTG Network Monitor, the software described in this document, is a complete solution for monitoring small, medium, and large networks.

## Monitoring Networks with PRTG Network Monitor

PRTG Network Monitor is a powerful network monitoring application for Windows-based systems. It is suitable for small, medium, and large networks and capable of LAN, WAN, WLAN, and VPN monitoring. You can also monitor physical or virtual web, mail, and file servers, Linux systems, Windows clients, routers, and many more. PRTG monitors network availability and bandwidth usage, as well as various other network parameters such as quality of service, memory load, and CPU usages. It provides system administrators with live readings and periodical usage trends to optimize the efficiency, layout, and setup of leased lines, routers, firewalls, servers, and other network components.

The software is easy to set up and use and monitors a network using Simple Network Management Protocol (SNMP), Windows Management Instrumentation (WMI), packet sniffer, Cisco NetFlow (as well as IPFIX, sFlow, and jFlow), and many other industry standard protocols. It runs on a Windows-based machine in your network for 24-hours every day. PRTG Network Monitor constantly records the network usage parameters and the availability of network systems. The recorded data is stored in an internal database for later analysis.

## 1.1 About this Document

This document introduces you to the system concepts of **PRTG Network Monitor** and explains how to set up the software to achieve the best monitoring results. You will learn how to plan your monitoring setup, how to set up your devices and sensors, dependencies, reports, notifications, maps, user accounts, and clustering for fail-safe monitoring.

This document is also meant as a reference for all available settings. Short contextual help is already provided within the Ajax web interface; in this manual you often get some more help regarding the different options available.

This document does **not** explain monitoring protocols and file formats in-depth. Also, the use of the Application Programming Interface (API) built into PRTG is only briefly addressed. Whenever possible, hyperlinks to more detailed resources are provided, such as articles in the [Paessler Knowledge Base](#).

To start using PRTG right away, please see the [Quick Start Guide](#)<sup>32</sup> section. For more detailed instructions, see the other sections.

## 1.2 Key Features

PRTG Network Monitor monitors your network and requires no third party software. Conducting a quick ad-hoc download, you do not need to fill web forms and will not have any registration hassles. The installation process requires only a few minutes, as well as the first configuration which is mainly done automatically. The initial setup is achieved by an interactive guidance by the software.

### What PRTG Can Be Used For

- Monitor and alert due to uptimes/downtimes or slow servers.
- Monitor system health of various hardware devices.
- Monitor and account bandwidth and network device usage.
- Monitor applications.
- Monitor virtual servers.
- Monitor Service Level Agreement (SLA).
- Monitor system usage (CPU loads, free memory, free disk space, etc.).
- Monitor performance of databases as well as monitor databases directly.
- Monitor email servers and use this feature to monitor various backup solutions.
- Monitor the environment.
- Classify network traffic by source/destination and content.
- Discover unusual, suspicious, or malicious activity with devices or users.
- Measure QoS and VoIP parameters and control service level agreements (SLA).
- Discover and assess network devices.
- Find unexpected relationships between your network components to detect potential security issues and to explore the real usage of your network and hardware.
- Monitor fail-safe using a failover cluster setup.

### What PRTG Includes

The PRTG installer contains all modules and software necessary to run the monitoring system without the need for third party modules, including:

- High performance: PRTG's own fast and efficient database system to store the raw monitoring results as well as logs, Toplists, and tickets (outperforms SQL servers for monitoring data), accessible through Application Programming Interface (API). You can distribute high loads over multiple probes.
- Low system requirements: an average PC from the year 2007 is sufficient and even a netbook can monitor over thousand sensors.

- High security standards: SSL encryption for connections and web server, and multiple user accounts with shared and private sensors, as well as rights management, and many more.
- Built-in SSL secured web server with HTTP and HTTPS support for the user interface.
- Fast web interface, works as Single Page Application (SPA) to avoid time-extensive reloading of the page.
- Mail server for automatic email delivery.
- Flexible alerting
  - including nine notification technologies, for example, email, SMS, syslog and SNMP trap, HTTP request, event log, Amazon SNS, executing scripts, etc.
  - including various triggers, for example, status alerts, limit alerts, threshold alerts, multiple condition alerts, escalation alerts.
  - including dependencies to avoid alarms floods, acknowledging alarms to avoid further notifications for this alarm, and alert scheduling.
- In-depth report generator to create reports on-the-fly as well as scheduled reports in HTML or Portable Document Format (PDF). Many report templates are available by default.
- Graphics engine for user-friendly live and historic data charts.
- Network analysis module to automatically discover network devices and sensors.
- Distributed monitoring to monitor several networks in different locations.
- Special features for Managed Service Provider (MSP) to monitor customer networks and increase the quality of service.
- Data publishing with real time dashboards—private and public—including live performance and status information. You can design these maps as you like with many different objects, as well as you can integrate external custom objects.
- Different languages like English, German, Spanish, French, Portuguese, Dutch, Czech, Japanese, and Simplified Chinese.
- Customizations: The PRTG Application Programming Interface (API) allows you to program your own features and to customize and re-brand PRTG's web interface to your needs. In addition, you can create custom sensors, notifications, and device templates.

PRTG Network Monitor supports monitoring up to 20,000 thousand sensors per installation. It can optionally work with multiple remote probes to monitor multiple sites or network segments from one central core installation, and to distribute high loads. You can also configure fail-safe monitoring using a cluster installation to perform automatic failovers. Single failover installations are allowed with every PRTG license.

The software is based on Paessler's reliable monitoring technology, which has been constantly improved since 1997 and is already used by more than 150,000 users around the world every day. An outstanding support ensures that your inquiries are answered within one business day in order to ensure best possible network monitoring. Attractive licensing packages from freeware (up to 10 sensors) to enterprise level (with thousands of sensors) make sure that every user finds the proper solution.

## 1.3 New in This Version

With ongoing **continuous development and rollout**, we constantly extend and improve on the functionalities provided by PRTG. Instead of delivering just a few versions distributed over the year with massive changes in every version, PRTG is automatically and seamlessly enhanced with new features and fixes—fast and with high quality. There are three release channels for PRTG:

- **Stable**: best tested version of PRTG for live systems; updated about once or twice a month; for usage on live systems
- **Preview**: offering the latest features and fixes; updated about once a week; consider this version as "beta", thus, **do not use** this version on live systems you have to depend on!
- **Canary**: providing "nightly builds"; updated very often; not tested extensively; **never use** on live systems you have to depend on!

Because of these three channels, you can choose either maximum stability, earlier access to new features, or a mixture of both.

For an overview of all most recent changes in the current version, please visit the version history on our website. Please see the [More](#)<sup>18</sup> section below for more information.

## 1.4 Available Licenses

There are four different PRTG flavors available.

### Freeware Edition

The Freeware Edition is a good solution to get started with PRTG, or for private use:

- May be used for free for personal and commercial use.
- Can monitor up to 10 sensors.
- Supports all available sensor types.
- Shortest available monitoring interval is one minute.

**Note:** If you want to use the Freeware Edition, please first install the [Trial Edition](#)<sup>[19]</sup> and get a free trial key. After the trial period has ended, your Trial Edition will automatically revert into a Freeware Edition.

### Special Edition

The Special Edition has all the features of the Freeware Edition, plus it supports up to 30 sensors. By entering a Special Edition key, you can extend your Freeware Edition. This key is not for download, we only hand it out on special request. For detailed information, see [More](#)<sup>[20]</sup> section below.

### Trial Edition

The Trial Edition is intended for evaluation purposes for customers who are interested in purchasing commercial licenses:

- Can monitor an unlimited number of sensors.
- Supports all available sensor types.
- Shortest available monitoring interval is one second (not officially supported; a minimum interval of 10 seconds is recommended).
- Temporary license key must be requested from Paessler's website.
- Trial period limited to 30 days (automatically reverts to [Freeware Edition](#)<sup>[19]</sup> afterwards).
- With each license one single failover [cluster setup](#)<sup>[81]</sup>, consisting of two nodes, is included. Cluster installations with two and three failover nodes will require one additional trial license key; a cluster installation with four failover nodes will require two additional trial license keys.

After the trial period has ended, a Trial Edition will revert into a Freeware Edition, allowing you to monitor up to 10 sensors for free.

## Commercial Editions

There are several licenses of PRTG Network Monitor available to suit the demands of smaller, as well as larger customers and organizations:

- Can monitor maximum number of sensors (from 100 to unlimited).
- Supports all available sensor types.
- Shortest available monitoring interval is one second (not officially supported; a minimum interval of 10 seconds is recommended).
- With each license one single failover [cluster setup](#)<sup>[81]</sup>, consisting of two nodes, is included. Cluster installations with two and three failover nodes will require one additional license of the same size; a cluster installation with four failover nodes will require two additional licenses of the same size.

For more information about available commercial licenses, please see [More](#)<sup>[20]</sup> section below.

## 1.5 System Requirements

In order to install and work with PRTG Network Monitor, you need to meet the following requirements:

- A PC server or virtual machine with roughly the CPU performance of an average PC built in the year 2007 or later and minimum 1024 RAM memory. For [cluster](#)<sup>[81]</sup> installations, use systems with similar performance.
- Operating systems Microsoft Windows 7, Windows 8, Server 2012, Server 2012 R2, Windows 2003 SP1 or later, or Windows 2008 R2 (all 32-bit or 64-bit) are officially supported. You can also use Windows Vista or 2008 R1, but we recommend not using these systems, because there are known performance issues related to them.
- Web browser to access the web interface. The following browsers are supported:
  - Google Chrome 34 or later (recommended)
  - Mozilla Firefox 28 or later
  - Microsoft Internet Explorer 10 or 11

### Planning an Installation With Hundreds of Sensors or More?

As a rule of thumb, an average PC/server built in the year 2007 or later should be able to monitor 1,000 sensors with ease. Some exceptions apply for version 3 of Simple Network Management Protocol (SNMP), Windows Management Instrumentation (WMI) and packet sniffer. The maximum number of sensors you can monitor with one installation of PRTG mainly depends on the monitoring technology and the monitoring intervals you use. In general, consider the following rules:

- **SNMP V1 and V2, Ping, Port, and HTTP**  
These sensor types are recommended for scenarios with thousands of sensors. With these technologies up to 20,000 sensors are possible.
- **SNMP V3**  
You will be able to monitor about 5,000 SNMP V3 sensors with an interval of 60 seconds on a common two core computer, and about 10,000 sensors on a four core system (the main limiting factor is your CPU power).
- **WMI**  
Try to keep the number of WMI sensors per probe below 120 sensors (with 60s interval), or 600 sensors (with 300s interval).
- **xFlow (IPFIX, NetFlow, sFlow, jFlow)**  
Monitoring the maximum number of sensors depends on the traffic pattern, the number of xFlow packets per second received by the PRTG probe, as well as the performance of the probe system (see site planner tool linked in the [More](#)<sup>[22]</sup> section below).
- **Packet Sniffer**  
These sensors create the highest CPU load on the probe system. This technology is only recommended for monitoring of low traffic connections (<50 Mbit/s steady stream). When traffic is often over 10 Mbit/s a dedicated [remote probe](#)<sup>[204]</sup> should be used.

- **VMware Monitoring**

Monitoring of VMware is limited to about 20 sensors at a 60 seconds monitoring interval, or 100 sensors at a 5 minutes interval. These limitations issue from the VMware platform. A registry hack is available to boost this to 150 sensors at a 5 minutes interval (this will require a change in the ESX/vCenter configuration). For details please see [More](#)<sup>[22]</sup> section below.

- **Other sensor types**

The impact of a specific sensor type on performance is indicated by a color range when adding a sensor to a device. It ranges from dark green (very low impact; 5,000 sensors per probe) to bold red (very high impact; 50 sensors per probe).

To overcome any limitations mentioned above you should distribute the sensors over two [remote probes](#)<sup>[20]</sup> or more. For detailed information please use the site planner tool to plan large installations. See [More](#)<sup>[22]</sup> section below.

We recommend using a dedicated physical machine to run both the PRTG core server and PRTG remote probes. For more information please see the [Detailed System Requirements](#)<sup>[23]</sup> section.

## 1.5.1 Detailed System Requirements

This section lists different aspects of system requirements for PRTG. Please consider these requirements in order to avoid issues while network monitoring.

- [Supported Operating Systems](#)<sup>[23]</sup>
- [Hardware Requirements](#)<sup>[24]</sup>
- [Sample Configurations](#)<sup>[25]</sup>
- [Running PRTG on Virtual Machines](#)<sup>[27]</sup>
- [Web Browser Requirements](#)<sup>[28]</sup>
- [Screen Resolution](#)<sup>[28]</sup>
- [Requirements for Monitored Devices](#)<sup>[28]</sup>
- [Requirements for the Enterprise Console](#)<sup>[29]</sup>
- [Requirements for Mobile Web GUI](#)<sup>[29]</sup>
- [Requirements for Smart phones](#)<sup>[29]</sup>
- [More](#)<sup>[29]</sup>

### Supported Operating Systems

The 32-bit and 64-bit versions of the following operating systems are officially supported for PRTG **Core Service** and **Probe Service** (Intel x86/x64 architectures only):

- Microsoft Windows 7
- Microsoft Windows 8
- Microsoft Windows Server 2008 R2 and Windows Server 2008 R2 SP1
- Microsoft Windows Server 2012\*\*
- Microsoft Windows Server 2012 R2\*\*
- Microsoft Windows Server 2003 SP1 or later
- Microsoft Windows Vista\*
- Microsoft Windows Server 2008\*

\* For performance reasons, we do not recommend using Windows Vista or Windows Server 2008 R1, especially when monitoring via Windows Management Instrumentation (WMI). Using these operating systems, you will only be able to add a limited number of WMI sensors! For detailed information, please see [More](#)<sup>[29]</sup> section below. If you need to use Windows Server 2008 R1, we strongly recommend installing Service Pack 2 (SP2).

\*\* Windows Server 2012 in **Core** mode and the **Minimal Server Interface** are not officially supported.

The version (32-bit or 64-bit) of the PRTG Core Server depends on the version of your operating system. The 64-bit version of the PRTG Core Server will be installed if

- the operating system is a 64-bit Windows system, **and**
- the system provides 6GB RAM or more.

Otherwise the 32-bit version of the PRTG Core Server will be installed.

We recommend you to provide Microsoft .NET Framework versions 3.5 and 4.0 (with latest updates) on all systems running a PRTG probe. **Note:** Version 4.0 is imperatively needed for monitoring VMware and XenServer virtual environments.

**More details:** Some sensor types need the Microsoft .NET Framework to be installed on the computer running the PRTG probe. This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>2050</sup>. Depending on the sensor type, the required versions are 2.0, 3.0, or 4.0. **Note:** According to the Microsoft website, .NET version 3.5 contains versions 2.0 SP1 and 3.0 SP1. Version 4.0 is not downward compatible, but must be installed side-by-side to older version(s), if required.

For best performance of hybrid sensors using Windows Performance Counters and Windows Management Instrumentation (WMI), we recommend Windows 2008 R2 or higher on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>2050</sup>.

## Hardware Requirements

Hardware requirements for PRTG **Core Service** and **Probe Service** mainly depend on the sensor types and intervals used. The following values are provided as reference for common usage scenarios of PRTG (based on a default sensor interval of 60 seconds).

- **CPU**  
An average PC built in 2007 can easily monitor 1,000 sensors (see sensor type specific notes below). PRTG supports native x86 architectures.
- **RAM memory**  
Minimum requirement: 1024 MB RAM. You will need about 150 KB of RAM per sensor.
- **Hard Disk Drive**  
You will need about 200 KB of disk space per sensor per day (for sensors with 60 second interval).
- **Internet connection**  
An internet connection is required for license activation (via HTTP or email).
- **Stable network connection for remote probes**  
Remote probes require a stable network connection between the PRTG core server and the remote probe. Unstable connections, for example via 3G, might work but it could be possible that you lose monitoring data if the connection is non-reliable.

There are also non-hardware dependent limitations for some sensor types, for example, WMI and SNMP V3 sensors. These limitations can be overcome by distributing the sensors across multiple [remote probes](#)<sup>[2049]</sup>. If you plan installations with more than 500 to 1,000 sensors, or more than 10 Packet Sniffer or xFlow (NetFlow, sFlow) sensors, please consult the site planner tool linked in the [More](#)<sup>[29]</sup> section below.

## Sample Configurations

The sample configurations in the table below will give you an overview of the hardware requirements for PRTG, based on your configuration.

## Part 1: Welcome to PRTG Network Monitor | 5 System Requirements

## 1 Detailed System Requirements

	Large Installation A	Large Installation B	Netbook Installation
<b>System</b>	DELL Alienware	DELL PowerEdge 2900 III	DELL Inspiron Mini 10
<b>CPU</b>	Intel Core2 Quad-Core 2.6 GHz	Intel Xeon Quad-Core 1.87 GHz	Intel Atom Z520 1.33 GHz
<b>RAM</b>	8 GB	16 GB	1 GB
<b>Operating System</b>	Windows 7 64-Bit	Windows 2003 64-Bit	Windows XP 32-Bit
<b>Sensors</b>	20,000 SNMP 100 Other	20,000 SNMP	600 SNMP 750 WMI
<b>Installation Corresponds To</b>	400 switches à 48 ports	400 switches à 48 ports	24 switches à 25 ports + 30 Windows server
<b>Scanning Interval</b>	1 minute	1 minute	5 minutes
<b>Number of Probes</b>	4	1	1
<b>Average CPU Load While Monitoring*</b>	3 %	20 %	35 %
<b>Average CPU Load While Generating Reports*</b>	20 %	30 %	85 %
<b>Average Memory Used</b>	3 GB	3.5 GB	260 MB
<b>Average Data Written to Disk Per Year</b>	800 GB	800 GB	55 GB
<b>Average Network Load</b>	80 kbit/s	550 kbit/s	150 kbit/s

\* CPU load is higher while users are accessing the web interface.

## Running PRTG on Virtual Machines

PRTG core server as well as PRTG probe can be run on virtualized platforms. The following platforms were tested successfully:

Virtual Host Technology	Client OS
VMware ESX/ESXi versions 3.5, 4.0, or 5.0	Windows XP, Windows 2003 SP1 or later (32/64 bit), Windows Vista, Windows 7 (32/64 bit), Windows 2008 (32/64 bit), Windows 8 (32/64 bit), Windows 2012 (32/64 bit)
VMware Server 2.0	Windows XP, Windows 2003 SP1 or later (32/64 bit), Windows 2008, Windows 8 (32/64 bit), Windows 2012 (32/64 bit)
XEN Server 5.0	Windows XP, Windows 2003 SP1 or later (32/64 bit), Windows 2008, Windows 8 (32/64 bit), Windows 2012 (32/64 bit)
Parallels Virtuozzo Containers	Windows 2003 Server SP1 or later (32/64 bit), Windows 2008 Server, Windows 8 (32/64 bit), Windows 2012 (32/64 bit)
Cloud Hosting Platforms (Amazon EC2, TheRackspaceCloud, and others)	Windows Server 2003 SP1 or later, Windows Server 2008, Windows 8 (32/64 bit), Windows 2012 (32/64 bit)

**Important notice:** We recommend using a dedicated physical machine to run both the PRTG core server and PRTG remote probes. If you run PRTG on a virtual machine, we strongly recommend to stay below 2,000 sensors for performance reasons. Unfortunately, we cannot offer technical support regarding performance and stability problems for PRTG installations on virtual machines that run with more than 5,000 sensors. In this case, please migrate PRTG to one or more, preferably physical, machines.

**Note:** When running PRTG on a virtual machine, do **not** use dynamic resource allocation, but please make sure that full resources are available to the virtual machine at any time. In our experience, dynamic resource allocation is not working efficiently for a monitoring software and can therefore lead to massive performance issues.

Please see also section [More](#)<sup>29</sup> regarding running PRTG on VMware.

## Web Browser Requirements

The following browsers are officially supported by the PRTG web interface (in order of performance and reliability):

- Google Chrome 34 or later (recommended)
- Mozilla Firefox 28 or later
- Microsoft Internet Explorer 10 or 11

**Note:** Deprecated Internet Explorer versions as well as mobile browsers might not be able to display the full featured [Ajax web interface](#)<sup>[100]</sup>. Using these browsers, you can access the feature-limited [Mobile Web GUI](#)<sup>[1947]</sup>, which does not require CSS or Javascript capability.

PRTG's web interface makes heavy use of Javascript and AJAX. We found that for some functions Chrome is up to 10 times faster than Internet Explorer, and 3 to 5 times faster than Firefox.

## Screen Resolution

A screen resolution of at least 1024x768 pixels is sufficient for most functions of PRTG. However, we recommend a screen resolution of 1200x800 or higher.

## Requirements for Monitored Devices

- **SNMP monitoring**  
The monitored device(s) must be equipped with SNMP Version 1, 2c, or 3 (i.e., an SNMP-compatible software must be installed on the device). SNMP must be enabled on the device and the machine running PRTG must be granted access to the SNMP interface.
- **Windows/WMI monitoring**  
In order to use WMI (Windows Management Instrumentation) monitoring, you will need a Windows network. For client PCs monitored with WMI, only the [operating systems as given above](#)<sup>[23]</sup> are officially supported. Windows 2000 is not officially supported. Please do not use Windows Vista or Windows 2008 R1 for WMI monitoring (they both have WMI performance issues). Windows XP is not officially supported and might not work with sensors which use **Remote Powershell**.
- **xFlow (IPFIX, NetFlow, sFlow) monitoring**  
The device must be configured to send NetFlow data packets (NetFlow version 5 or 9; IPFIX is the successor protocol of NetFlow 9) or sFlow packets (version 5) to the machine running the PRTG probe.
- **Packet Sniffer monitoring**  
Only data packets passing the local machine's network card can be analyzed. Switches with so-called 'monitoring ports' are necessary for network-wide monitoring in switched networks.
- **Other sensor types**  
Depending on the specific sensor type, you can find requirements (for example, modules, components, device configurations) which may have to be fulfilled in the corresponding manual section, as well as partly when adding the sensor to a device.

## Requirements for the Enterprise Console

The optional PRTG [Enterprise Console](#)<sup>[1894]</sup> runs under all Windows versions XP or later. It has a built-in webkit browser engine and requires no specific browser installed on the system. See also section [Enterprise Console—Requirements for Connections to PRTG Web Server\(s\)](#)<sup>[1894]</sup>.

## Requirements for Mobile Web GUI

The feature-limited mobile web interface is optimized for low bandwidth and mobile access. It has been designed for and tested with iOS (iPhone, iPad), Android, Blackberry, Windows Mobile, and also deprecated Internet Explorer versions.

## Requirements for Smartphones

The optional smartphone apps for iOS devices require iOS version 6 or later and PRTG v12 or later. For Android devices, the app "PRTG for Android" requires Android OS 4.0 or later (version 4.1 or later recommended), as well as PRTG Network Monitor 13.1 or later. For more information, please see [Smart phone Apps](#)<sup>[1950]</sup>. The [Mobile Web GUI](#)<sup>[1947]</sup> interface can be used on most phones with a browser. We successfully tested it on Symbian, BlackBerry, Windows, Android, and iOS devices.

# Part 2

## Quick Start Guide

## 2 Quick Start Guide

Welcome to PRTG Network Monitor! This section will support you with a quick start into PRTG, so you can start monitoring your network right away!

Setting up monitoring for your network is easy! You only need to download the installer from Paessler's website, run through the installation wizard, and provide some information in the configuration guru. PRTG will start monitoring your network immediately without any further complicated stumbling blocks! Of course, later on, you still can adjust everything to your needs.

Please see the following quick steps.

### Quick Start Guide—Topics

- [ONE—Download, Installation, and First Login](#) <sup>[33]</sup>
- [TWO—Using the Configuration Guru](#) <sup>[36]</sup>

## 2.1 ONE—Download, Installation, and First Login

Simply download and install the version of PRTG Network Monitor which meets your needs. For video tutorials with PRTG basics, please see section [More](#) <sup>35</sup> below.

### Download

On the Paessler website, you find two different installers for PRTG, a public download for the Freeware, Special, and Trial editions, and a login link to download the commercial editions (which is only available for paying customers).

**“Installation of PRTG Takes Less Than 2 Minutes!”**

Monitor your network now! No additional software is required. All you need is a Windows PC or VM.

Running PRTG in your network is quick&easy. After installation it will scan your network and the Auto-Discovery will create all the sensors that are required to monitor your network.

**Free Trial Download**  
No limitations for 30 days

**Freeware Download**  
Limited to 10 Sensors, Free Forever

<b>Version Number, File Size</b>	Version 13.4.7.3531 (November 19th, 2013), 120 MB
<b>Available Translations</b>	English, German, Spanish, French, Portuguese, Dutch, Czech, Japanese, and Simplified Chinese
<b>Operating Systems</b>	All Windows versions (XP or later, see <a href="#">System Requirements</a> )
<b>What's new?</b>	See <a href="#">Version History/Release Notes</a>
<b>Do you need the full version download?</b>	Please <a href="#">log into our website</a>

PRTG Download on Paessler Website with Marked Full Version Download Link

## Downloading the Freeware, Special, or Trial Edition

Please download the latest publicly available file from the Paessler website. You can also request a trial key there, which must be entered during installation:

- <http://www.paessler.com/prtg/download>

**Note:** Every Freeware installation will start as a Trial version, giving you an unlimited number of sensors for 30 days. After the trial period has expired, your installation will automatically revert to a Freeware edition with 10 sensors.

**Note:** A Special Edition is an extended Freeware version. If you meet certain requirements, you can receive a Special Edition key from us which gives you an extended number of sensors for free. For details, please see:

- <http://www.paessler.com/prtg/download#30sensors>

## Downloading the Commercial Edition

Downloads and updates are free to customers with an active maintenance contract. Please log into the Paessler website to get the latest download. You can also find your license key there, which must be entered during installation:

- <http://www.paessler.com/login>

If you do not have an active maintenance contract, please contact [sales@paessler.com](mailto:sales@paessler.com).

**Note:** Once installed, you will usually use the [Software Auto-Update](#)  function of PRTG to download and install new versions. This will further ease the process of installing updates.

## Installation

Please double click the setup file on the computer that will be your PRTG server. Follow the installation wizard and install the software.

At the end of the installation, a browser window will be opened automatically, and it will connect to the PRTG web interface, showing the **Configuration Guru**. Please make sure you load the web interface with one of the supported browsers:

- Google Chrome 34 or later (recommended),
- Mozilla Firefox 28 or later, or
- Microsoft Internet Explorer 10 or 11.

**Note:** Due to scripting incompatibilities, you might not be able to use all functionalities of the PRTG Ajax web interface with Internet Explorer 9 or earlier and other older browsers. If you cannot access the **Configuration Guru**, please open the URL of the PRTG web interface in another browser.

## Login

If everything works fine, you will not see the login screen on first startup. Only when switching browsers you will have to log in.

PRTG Login Screen

- Leave the **Login Name** and **Password** fields empty.
- Choose the **AJAX Web GUI (All features, optimized for desktop access)** option.
- Click on the **Default Login** button to login.

Please make sure you use a supported web browser when logging in to PRTG. Please use Google Chrome 34 or later (recommended), Mozilla Firefox 28 or later, or Microsoft Internet Explorer 10 or 11. Only with a supported browser you can use the **AJAX Web GUI (All features, optimized for desktop access)** option. If you see this option grayed out, please change your browser and open the URL again.

Please see the next step for more information about [Using the Configuration Guru](#) <sup>36</sup>.

## More

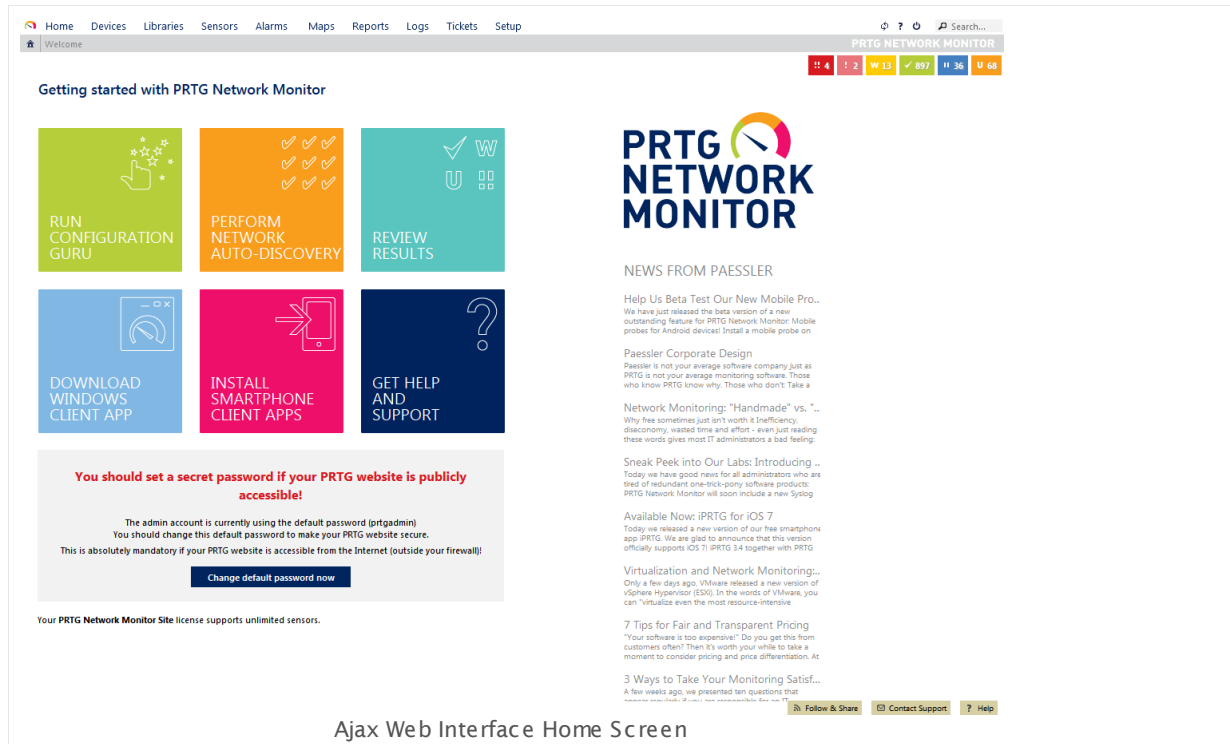

Video Tutorials for PRTG Network Monitor:

- [http://www.paessler.com/support/video\\_tutorials](http://www.paessler.com/support/video_tutorials)

## 2.2 TWO—Using the Configuration Guru

For a new installation, PRTG will open the Configuration Guru automatically after each login. It will reappear until you either ran through it completely or skipped it. In order to open it at any time, please click the Run Configuration Guru button on PRTG's Home screen.

**Note:** When using the [Enterprise Console](#), please start the Guru by selecting **Help | Run Configuration Guru** from the main menu.

By answering about ten simple questions, this assistant will guide you through an initial setup and pre-configure an essential monitoring of your network including important devices, servers, and websites. You can later adjust these automatically generated monitoring settings later by hand.

Configuration Guru Start Screen

The steps to go are:

- [Enable SSL Encryption](#) <sup>[38]</sup>
- [Configure Administrator Account](#) <sup>[38]</sup>
- [Enter Windows/WMI Credentials](#) <sup>[38]</sup>
- [Enter SNMP Credentials](#) <sup>[39]</sup>
- [Enter VMware/XenServer Credentials](#) <sup>[39]</sup>
- [Enter Linux/Solaris/Mac OS Credentials](#) <sup>[40]</sup>
- [Monitor Your Internet Connection](#) <sup>[40]</sup>
- [Monitor LAN Servers](#) <sup>[40]</sup>
- [Monitor Websites/Online Shops](#) <sup>[41]</sup>
- [Monitor Cloud Services](#) <sup>[41]</sup>
- [Discover a Network Segment](#) <sup>[42]</sup>
- [You Are Done!](#) <sup>[42]</sup>

Click on the **Start Guru** button to start. You can skip a step at any time by clicking on the **Skip** button.

## Enable SSL Encryption

This step is shown only if your web server runs on http. We recommend running the PRTG web interface using SSL encryption (https), especially if you make your web interface available from the internet. Without encryption your passwords are sent over your network unencrypted. Choose between:

- **Yes:** Switch the PRTG web server to use SSL. A popup will appear, showing you the screen shot of a certificate security warning that will be shown the next time you load the PRTG web interface. Confirm by clicking the button **Yes, switch to SSL now**. After you confirm, the PRTG core server Windows service will be restarted and the web interface will be reloaded, most likely showing a certificate warning. Confirm it to proceed to the login screen. For more information, please see [SSL Certificate Warning](#)<sup>[105]</sup>.
- **No:** Skip this step and keep using an unencrypted http connection. Once you skipped this step, it will not be shown again. You can switch to SSL later by using the PRTG Server Administrator tool from the Windows start menu. For more information, please see [PRTG Server Administrator](#)<sup>[199]</sup>.

Click the **Save & Next** button to apply your settings, or click the **Skip** button to skip this step. Both buttons will take you to the next step.

## Configure Administrator Account

By default, PRTG uses the administrator account with login name **prtgadmin** and password **prtgadmin**. For security reasons you should at least change the password.

Please enter credentials and email address for the administrator account.

The password must meet the following requirements:

- at least eight characters long
- at least one number
- at least one capital letter

Click the **Save & Next** button to apply your settings, or click the **Skip** button to skip this step. Both buttons will take you to the next step.

## Enter Windows/WMI Credentials

In order to monitor your Windows clients and servers via Windows Management Instrumentation (WMI), please enter Windows administrator credentials for your network. We recommend using Domain Administrator credentials (if you're using an Active Directory).

PRTG will store these credentials in the [Root](#)<sup>[224]</sup> group of your device tree. All Windows-based devices will automatically inherit and use them for monitoring. You can discontinue [Inheritance of Settings](#)<sup>[87]</sup> at any level, entering other credentials instead.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

Click the **Save & Next** button to apply your settings, or click the **Skip** button to skip this step. Both buttons will take you to the next step.

## Enter SNMP Credentials

In order to monitor your hardware (router, switches, etc.), Simple Network Management Protocol (SNMP) is the most common protocol used. Usually, all SNMP-enabled devices use the same settings by default: SNMP **version 1**, community string **public**, SNMP **port 161**).

You only need to change values here if the SNMP-enabled devices in your network use other settings. Choose between:

- **No:** You SNMP-enabled devices use the default configuration. If you're not sure, choose this option.
- **Yes:** Choose this option to enter your own SNMP credentials and settings. More settings will appear. Choose the SNMP version, enter the community string and SNMP port number, and define a time out for SNMP connections.

PRTG will store these credentials in the [Root](#)<sup>[224]</sup> group of your device tree. All SNMP-based devices will automatically inherit and use them for monitoring. You can discontinue [Inheritance of Settings](#)<sup>[87]</sup> at any level, entering other credentials instead.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>[1956]</sup> section.

Click the **Save & Next** button to apply your settings, or click the **Skip** button to skip this step. Both buttons will take you to the next step.

## Enter VMware/XenServer Credentials

If you use the virtual environments VMware or Citrix XenServer, PRTG can monitor them as well. To do so, please enter root access credentials for those systems. Choose between:

- **No:** PRTG will not monitor virtual environments. You can later add those credentials.
- **Yes:** Please enter user name and password for VMware or XenServer systems. For VMware, please also specify the protocol that will be used to connect.

PRTG will store these credentials in the [Root](#)<sup>[224]</sup> group of your device tree. All VMware/XenServer-based devices will automatically inherit and use them for monitoring. You can discontinue [Inheritance of Settings](#)<sup>[87]</sup> at any level, entering other credentials instead.

For an overview of all available VMware and XenServer sensors, please see [List of Available Sensor Types](#)<sup>[296]</sup>, section "Virtual Servers Sensors".

Click the **Save & Next** button to apply your settings, or click the **Skip** button to skip this step. Both buttons will take you to the next step.

## Enter Linux/Solaris/Mac OS Credentials

If you have systems running on Linux, Solaris, or Mac OS X, PRTG can monitor them as well. To do so, please enter root access credentials for those systems. Choose between:

- **No:** PRTG will not monitor devices via SSH/WBEM. You can later add those credentials.
- **Yes:** Please enter SSH/WBEM credentials. You can either provide username and password, or paste a private key. For WBEM access, please also define protocol and port. Additionally, specify the rights an SSH command will be executed with.

PRTG will store these credentials in the [Root](#)<sup>[224]</sup> group of your device tree. All SSH/WBEM-based devices will automatically inherit and use them for monitoring. You can discontinue [Inheritance of Settings](#)<sup>[87]</sup> at any level, entering other credentials instead.

For a general introduction to SSH monitoring, please see [Monitoring via SSH](#)<sup>[1902]</sup> section.

Click the **Save & Next** button to apply your settings, or click the **Skip** button to skip this step. Both buttons will take you to the next step.

## Monitor Your Internet Connection

PRTG can monitor the availability of your default gateway and DNS servers. It will try to automatically detect and pre-populate the respective fields with the correct IP addresses. Please review and/or enter the IP addresses of your default (internet) gateway and your DNS server(s). Enter each IP address/DNS name in one line.

**Note:** For most networks, the gateway is the IP address or DNS name of your firewall or router. If you do not have a second DNS server, simply leave the respective field blank.

PRTG will create a new device for each entry and run an auto-discovery to set up sensors. In the background, auto-discovery will start immediately after you confirm this step.

Click the **Save & Next** button to apply your settings, or click the **Skip** button to skip this step. Both buttons will take you to the next step.

## Monitor LAN Servers

PRTG can monitor your AD domain controllers, Exchange or other mail servers, as well as additional servers in your network. PRTG will try to automatically detect and pre-populate the respective fields with the correct IP addresses. Please review and/or enter the entries for your Active Directory domain controllers and mail servers. Enter each IP address/DNS name in one line.

PRTG will create a new device for each entry and run an auto-discovery to set up sensors. In the background, auto-discovery will start immediately after you confirm this step.

**Note:** Your entries will not be shown in the Configuration Guru after confirming this step but will be added as devices to your device tree nevertheless. The Configuration Guru option **Monitor LAN Servers** will be marked with a green check mark as well if one or more servers were defined in this section.

Click the **Save & Next** button to apply your settings, or click the **Skip** button to skip this step. Both buttons will take you to the next step.

## Monitor Websites/Online Shops

PRTG can monitor your website and online shop using http. Simply enter the URLs you want to monitor, each in one line.

PRTG will create a new device for all of your websites, with one sensor for each URL.

Click the **Save & Next** button to apply your settings, or click the **Skip** button to skip this step. Both buttons will take you to the next step.

## Monitor Cloud Services

To see if the cloud services that you usually use are up and running, PRTG can set up http sensors for those as well. In the list of services, simply switch the radio button to **Yes** for each service you want to monitor. Choose from:

- **Google Search, Google Mail, Google Drive**
- **Microsoft Office 365**
- **Salesforce**
- **Dropbox**
- **iCloud**
- **Facebook**
- **Twitter**
- **Skype**

PRTG will create a new device for all of cloud services, with one sensor for each URL.

Click the **Save & Next** button to apply your settings, or click the **Skip** button to skip this step. Both buttons will take you to the next step.

## Discover a Network Segment

PRTG can scan an entire network segment, automatically detect devices, and create sensors using its auto-discovery.

PRTG will try to automatically detect and pre-populate the respective fields with the correct IP range. Please review and/or enter the entries. In the **IPv4 Base** field, enter the first three octets of your network's IP range, for example **192.168.0** or **10.0.0**, or whatever IP address range you use. If you don't change the default values for **IPv4 Range Start** and **End**, PRTG will automatically complete the IP base and scan all IP addresses ending in **.1** to **.254**.

If you need more options regarding the definition of IP ranges, you can run additional auto-discoveries later. Please see [Auto-Discovery](#)<sup>[190]</sup> for more details.

Click the **Save & Next** button to apply your settings, or click the **Skip** button to skip this step. Both buttons will take you to the next step.

## You Are Done!

While you were busy using the guru, PRTG has already created devices and sensors for you. There are first monitoring values available, too. In the meantime, you can follow PRTG on your favorite social network by clicking on of the buttons for Facebook, Twitter, or Google +.

Click on the **OK! Let me view my new sensors!** button to view the device tree.

In order to get familiar with the PRTG web interface, we recommend you proceed with section [General Layout](#)<sup>[108]</sup> of the web interface, or with [General Layout](#)<sup>[189]</sup> of the Enterprise Console.

# Part 3

## Installing the Software

## 3 Installing the Software

This section describes how to download and install your PRTG product.

PRTG Setup

Please see the following sections for more information.

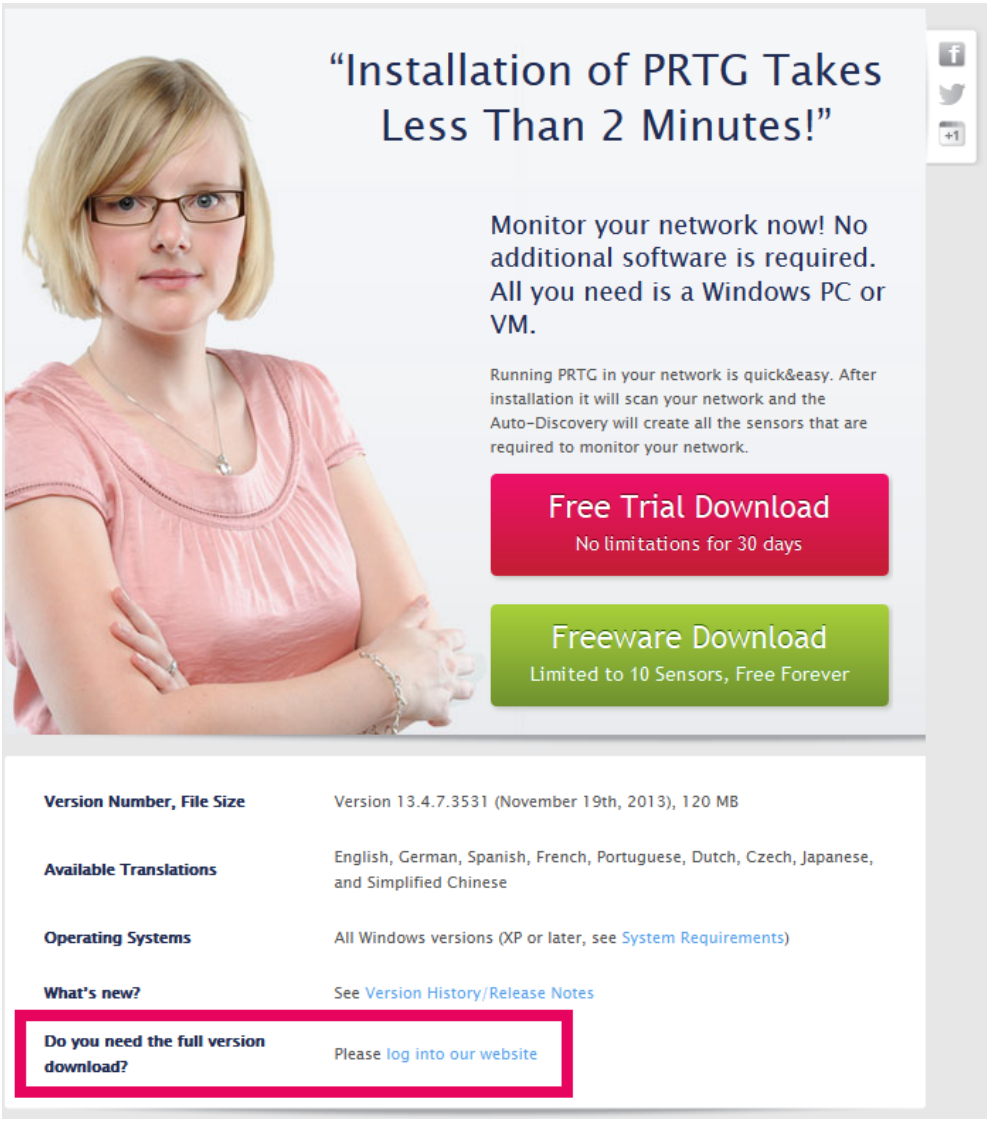

### Installing the Software—Topics

- [Download PRTG](#) <sup>45</sup>
- [Update From Previous Versions](#) <sup>47</sup>
- [Install a PRTG Core Server](#) <sup>51</sup>
- [Install a PRTG Cluster](#) <sup>56</sup>
- [Enter a License Key](#) <sup>57</sup>
- [Activate the Product](#) <sup>60</sup>
- [Install a PRTG Remote Probe](#) <sup>62</sup>
- [Install the Enterprise Console](#) <sup>67</sup>
- [Uninstall PRTG Products](#) <sup>71</sup>

## 3.1 Download PRTG

On the Paessler website, you find two different installers for PRTG, a public download for the Freeware, Special, and Trial editions, and a login link to download the commercial editions (which is only available for paying customers).

**“Installation of PRTG Takes Less Than 2 Minutes!”**

Monitor your network now! No additional software is required. All you need is a Windows PC or VM.

Running PRTG in your network is quick&easy. After installation it will scan your network and the Auto-Discovery will create all the sensors that are required to monitor your network.

**Free Trial Download**  
No limitations for 30 days

**Freeware Download**  
Limited to 10 Sensors, Free Forever

<b>Version Number, File Size</b>	Version 13.4.7.3531 (November 19th, 2013), 120 MB
<b>Available Translations</b>	English, German, Spanish, French, Portuguese, Dutch, Czech, Japanese, and Simplified Chinese
<b>Operating Systems</b>	All Windows versions (XP or later, see <a href="#">System Requirements</a> )
<b>What's new?</b>	See <a href="#">Version History/Release Notes</a>
<b>Do you need the full version download?</b>	Please <a href="#">log into our website</a>

PRTG Download on Paessler Website with Marked Full Version Download Link

### Downloading the Freeware, Special, or Trial Edition

Please download the latest publicly available file from the Paessler website. You can also request a trial key there, which must be entered during installation:

- <http://www.paessler.com/prtg/download>

**Note:** Every Freeware installation will start as a Trial version, giving you an unlimited number of sensors for 30 days. After the trial period has expired, your installation will automatically revert to a Freeware edition with 10 sensors.

**Note:** A Special Edition is an extended Freeware version. If you meet certain requirements, you can receive a Special Edition key from us which gives you an extended number of sensors for free. For details, please see:

- <http://www.paessler.com/prtg/download#30sensors>

## Downloading the Commercial Edition

Downloads and updates are free to customers with an active maintenance contract. Please log into the Paessler website to get the latest download. You can also find your license key there, which must be entered during installation:

- <http://www.paessler.com/login>

If you do not have an active maintenance contract, please contact [sales@paessler.com](mailto:sales@paessler.com).

**Note:** Once installed, you will usually use the **Software Auto-Update**  function of PRTG to download and install new versions. This will further ease the process of installing updates.

## 3.2 Update From Previous Versions

If you already have installed a previous software version, there are several things you should consider before updating to the current PRTG version.

**Note:** We recommend you always have a proper backup of your monitoring data and configuration. In most cases both will be maintained when upgrading. Anyway, we recommend a backup before upgrading. Please see [More](#)<sup>[49]</sup> section below.

### Update From PRTG Network Monitor 12 or later

If you have been running PRTG Network Monitor with version 12, 13 or 14, simply [install](#)<sup>[51]</sup> the latest version on top of the previous version. Your configuration will be kept. If you have configured PRTG as a cluster, you only have to install an update on any node server (master or failover). The new version will then be deployed to the cluster automatically. **Note:** We recommend you always have a proper backup of your monitoring data.

**Note:** As of PRTG 14, **Internet Explorer 9 is no longer officially supported** for access to the PRTG web interface.

### Web Interface Customizations as of PRTG Network Monitor 13.2.3

As of PRTG version 13.2.3, the **website** folder of the PRTG program directory is not used any more. This means that if you update from an older PRTG version than 13.2.3 to the current version, all existing customizations of the web interface will be disabled and have to be revised. You may find a way for a similar customization that can be applied to the files in the current **webroot** folder which contains the web interface files now. For details, please see section [More](#)<sup>[49]</sup>.

### Update From PRTG Network Monitor 9

If you are using PRTG 9 now, your configuration will be kept when installing the current PRTG version in **Standalone Mode** or when installing a **Master Node**. There are only a few things you should consider.

- **Discontinued Sensors:** Existing instances of the following sensor types will stop working as of PRTG V12 and must be replaced with their successor sensor types!

- VMware Host Server (SOAP)
- VMware Virtual Machine (SOAP)
- Xen Virtual Machine

If your configuration contains these sensor types, they will stop monitoring after upgrading to the current version. We recommend you to pause them to keep their data. In order to continue monitoring, please add the sensors anew (for example, using the auto-discovery).

- **Please install .NET 4.0:** We strongly recommend installing .NET 4.0 on systems that run the core server (and the remote probes, if you use those). Otherwise the following features will not work: [VMware](#)<sup>[296]</sup> auto-discovery and monitoring, [Citrix XenServer](#)<sup>[343]</sup> auto-discovery and monitoring, [SIP Options Ping Sensor](#)<sup>[899]</sup>, [Windows Last Update Sensor](#)<sup>[1497]</sup>.

- **Changed Geo Maps Provider:** When you update to the current PRTG version, the provider for geographical maps will automatically be switched from Google Maps to MapQuest (using Open Street Map data).
- **Windows 2000 Not Supported:** Since PRTG 7 we do not officially support Windows 2000 systems any more. This means, PRTG cannot be installed on systems running Windows 2000, and you cannot officially monitor Windows 2000 systems (for example, via WMI). However, if you could successfully monitor your Windows 2000 systems with PRTG 9, this might actually not be possible any more with the current PRTG version. Especially the [WMI Service Sensor](#) [1640] will show an error message when monitoring Windows 2000 systems under the current PRTG version. For a work around, please see [More](#) [49] section below.

## Update From PRTG Network Monitor 7 or 8

If you are using PRTG 7 or 8 now, your configuration will be kept when installing the current PRTG version in **Standalone Mode** or when installing a **Master Node**. There are only a few things you should consider.

**Note:** If you're running PRTG 7 or 8 we recommend you first update to the latest PRTG 8 version as an intermediate step, in order to make sure all data is carried over correctly. Please [contact technical support](#) [2088] to obtain a download link for PRTG 8. In any case we recommend you always keep a proper backup of your configuration and monitoring data.

### Updating from PRTG 7 or 8 to Current PRTG Version

- Packet Sniffer (Content) sensors are not supported any more. Existing sensors of this type will automatically be switched to Packet Sniffer (Header) sensors after the update. As a benefit, you can now also sniff IPv6 traffic.
- Internet Explorer 8 is no longer supported for access to the PRTG Ajax web interface or to the mobile web GUI.
- You may experience a slow [Enterprise Console](#) [1894] (former 'Windows GUI') due to different reasons. For detailed information, please see the knowledge base article linked in the [More](#) [49] section below.
- When installing a failover node on top of an existing stand-alone PRTG 7, 8, 9, 12, or 13+ installation, the configuration cannot be kept and is written to a backup folder. Then, the new cluster configuration is received from the master node of the cluster. As all nodes work with the same configuration, a failover node's old configuration and monitoring data can no longer be used. If you want to keep a configuration of PRTG 7, please install the master node on top of the old installation and use other servers for the failover node installations.
- Since PRTG 9 the SNMP sensors use the **IPv4 Outgoing IP** set for the probe service (this setting was formerly ignored by those sensors, using the **auto** setting instead). If you experience failing sensors, please check the setting in the [PRTG Probe Administrator](#) [2018]. For detailed information please see [More](#) [49] section below.
- If you have (manually) configured the PRTG probe or PRTG core service to run under a different Windows user account (for example, for successful internet access through an ISA server firewall), please apply the respective Windows user account for the "PRTGProbeService" and/or "PRTGCoreService" anew after installing the current PRTG version. For detailed information please see [More](#) [49] section below.

- Probe core and probe now require: SP1 (or later) on Windows 2003, and SP2 (or later) on Windows XP.
- If you use the default data path in your PRTG setup, it will be changed automatically. Up to version 8 all data was stored in a sub folder reflecting a PRTG version number (v7 or v8). As of version 9 this sub folder is omitted, and data is stored directly at %ALLUSERSPROFILE%\Application data\Paessler\PRTG Network Monitor. During setup, all data will be moved to the new directory. If you use a custom data path it will not be changed.
- Up to version 8 all data in the registry was stored in a sub key reflecting a PRTG version number (v7 or v8). As of version 9 this sub key is omitted, and registry data is stored directly under the key HKEY\_LOCAL\_MACHINE\SOFTWARE\Paessler\PRTG Network Monitor (on 32-bit systems) respectively HKEY\_LOCAL\_MACHINE\SOFTWARE\Wow6432Node\Paessler\PRTG Network Monitor (on 64-bit systems). During setup, all existing registry values will be moved to the new key.

### Updating from PRTG 7 to Current PRTG Version

- Regarding custom sensors, the interpretation of returned values is handled more strict as of PRTG 8. If you're using custom sensors with PRTG 7, these may not work with the current PRTG version if they do not fully apply to the [API definition](#)<sup>[203]</sup>.

### Update From Older PRTG Products

For all other predecessor products, a direct data import into the current version is not possible.

If you have been using IPCheck 5 or PRTG Traffic Grapher 6, please perform a clean installation of PRTG Network Monitor and set up your configuration anew. Using PRTG's [Auto-Discovery](#)<sup>[190]</sup> is the easiest way to quickly configure a monitoring of your entire network. Please see [Quick Start Guide](#)<sup>[32]</sup> section for more information.

### 3.3 Install a PRTG Core Server

Installing PRTG is easy. It is similar to other Windows-based applications. To install the application please run the installation setup program from the ZIP file that you have downloaded.

Windows User Account Control Confirmation Request

Confirm the question of the Windows User Account Control with **Yes** to allow the program to install. The usual software installation wizard will guide you through the installation process.

Setup Language Selection

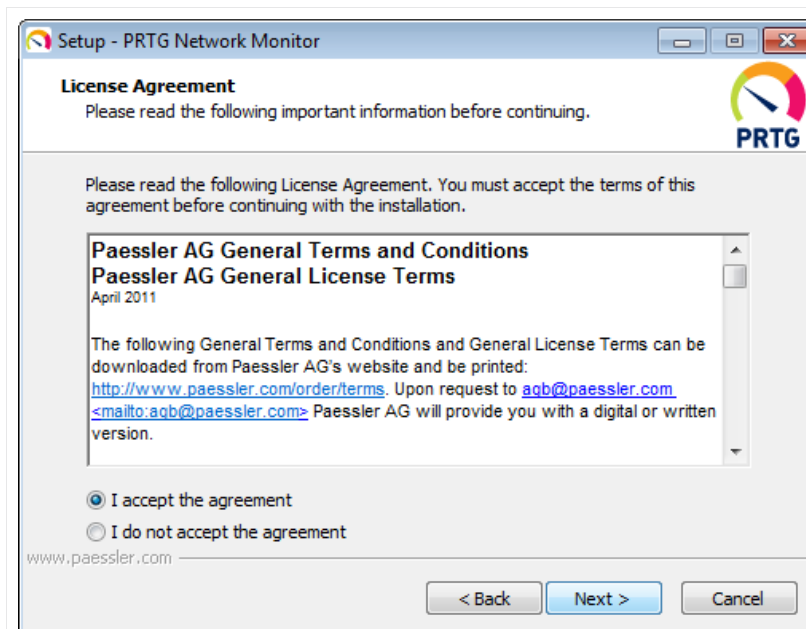

Please select a language for your product and click the **OK** button. The available language options depend on both your Windows version and the setup file.

## Part 3: Installing the Software | 3 Install a PRTG Core Server

Setup Wizard Start Screen

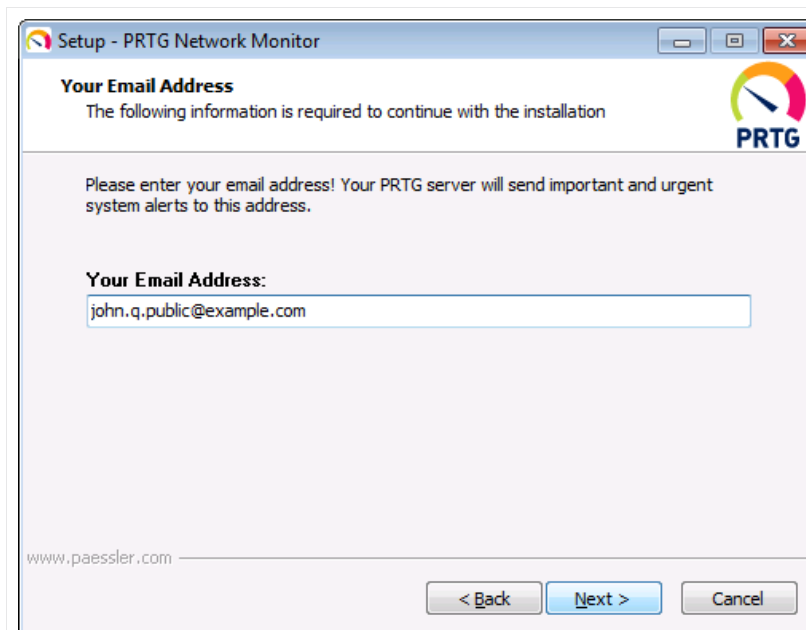

Please click **Next** to walk through the wizard.

Setup Wizard License Agreement

Please accept the license agreement and click **Next**.

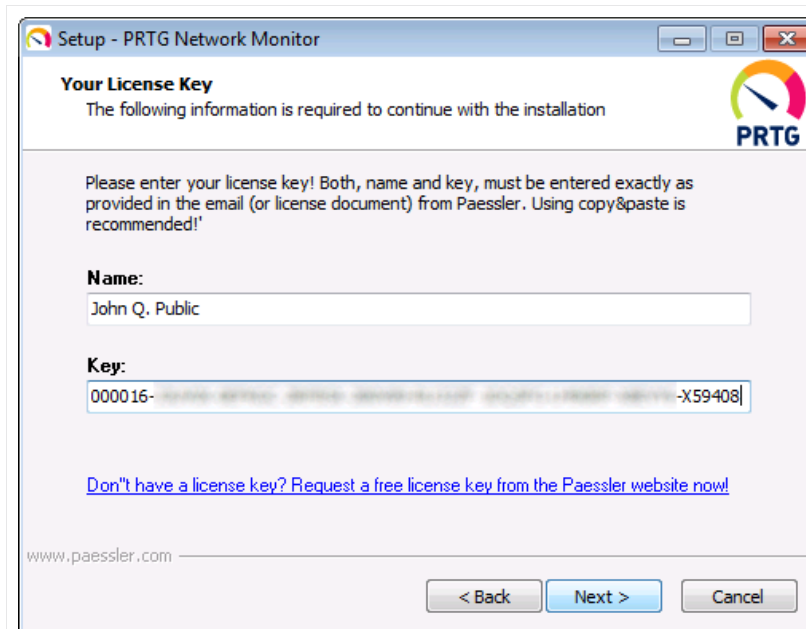

The screenshot shows the 'Setup - PRTG Network Monitor' window. The title bar includes the PRTG logo and standard window controls. The main heading is 'Your Email Address'. Below it, a message states: 'The following information is required to continue with the installation'. A sub-message reads: 'Please enter your email address! Your PRTG server will send important and urgent system alerts to this address.' There is a text input field labeled 'Your Email Address:' containing the text 'john.q.public@example.com'. At the bottom left is the URL 'www.paessler.com'. At the bottom right are three buttons: '< Back', 'Next >', and 'Cancel'.

Administrator Email Address

Please enter a valid email address. Your PRTG server will send important and urgent system alerts to this address. Click the **Next** button to continue.

The screenshot shows the 'Setup - PRTG Network Monitor' window. The title bar includes the PRTG logo and standard window controls. The main heading is 'Your License Key'. Below it, a message states: 'The following information is required to continue with the installation'. A sub-message reads: 'Please enter your license key! Both, name and key, must be entered exactly as provided in the email (or license document) from Paessler. Using copy&paste is recommended!'. There are two text input fields: 'Name:' containing 'John Q. Public' and 'Key:' containing '000016-XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX-X59408'. Below the key field is a blue hyperlink: 'Don't have a license key? Request a free license key from the Paessler website now!'. At the bottom left is the URL 'www.paessler.com'. At the bottom right are three buttons: '< Back', 'Next >', and 'Cancel'.

License Key Information

Please choose the folder you wish to install the software in. We recommend using the default value.

## Part 3: Installing the Software | 3 Install a PRTG Core Server

Setup Wizard Destination Location

As soon as you click **Next**, the necessary files will be copied to your disk.

Setup Wizard Installing

After installation, the [Ajax Web Interface](#)<sup>[100]</sup> is opened in your system's default browser. Please make sure there is Google Chrome 34 or later (recommended), Mozilla Firefox 28 or later, or Microsoft Internet Explorer 10 or 11 available on the system, and set as default browser (see [System Requirements](#)<sup>[21]</sup>).

## Enter License Information

Only if you entered incorrect license information before you will be asked to enter a correct license name and key.

**PAESSLER** PRTG Network Monitor

Enter License Key

Name: John Q. Public

Key: 0000- - - - - 9408

**Instructions:**

Please request a free trial key from the [Paessler Website](#). It consists of two parts: The **license name** (usually the company name) and the **license key** (10 groups of 6 letters and numbers each, separated by a dash). It is recommended to use copy&paste via the clipboard to make sure that both strings are entered exactly as given in your license document.

Product:	PRTG Network Monitor 100 with 12 months maintenance
License name:	My Company Name Inc.
License key:	0e#5V8-1JQD6D-SB10KC-H85ZQ9-548C61-8QTH91-QWCH99-5MY
Download:	<a href="#">Download link</a>

< Back Next >

Welcome Wizard Enter License Information

Please enter both **Name** and **Key** exactly as stated in the email received from Paessler. We recommend using copy&paste to avoid typing mistakes. For details, please see [Enter a License Key](#)<sup>[57]</sup>.

## More

Knowledge Base: What is the PRTG Special Edition license?

- <http://kb.paessler.com/en/topic/8063>

Knowledge Base: How can I establish a secure web interface connection to PRTG?

- <http://kb.paessler.com/en/topic/273>

Knowledge Base: PRTG blocks port 80 although I'm using SSL on port 443. How to free port 80?

- <http://kb.paessler.com/en/topic/5373>

## 3.4 Install a PRTG Cluster

PRTG offers single failover clustering in all licenses—even using the freeware edition. A single failover cluster consists of two servers ("Current Master" Node and "Failover Node"), each of them running one installation of PRTG. They are connected to each other and exchange configuration and monitoring data. You can run a cluster with up to 5 nodes.

For detailed information, please see [Failover Cluster Configuration](#) .

### More

Knowledge Base: What's the Clustering Feature in PRTG?

- <http://kb.paessler.com/en/topic/6403>

## 3.5 Enter a License Key

A license key for PRTG Network Monitor consists of the license name and a license key. The key is a string consisting of approx. 70 characters.

### Your Personal License Information

You should have received license name and key via email. This is either the information for a Trial or a Commercial Edition.

#### Example of License Information

License Name: **John Q. Public**  
License Key: **0223515-FFSEJC-ZHGRDFM-UR1CS8-U73FGK-G645F2-YVF1DD-H8323N-D11HG9-M2DRG**

During the setup process, PRTG will ask you to enter your license information. Please use copy and paste to fill out the form in the dialog shown by the installer.

- **Trial/Freeware license key:** When entering a Trial license key you can experience unlimited functionality of PRTG during the trial period. Your installation will automatically switch to a Freeware Edition afterwards. In details how to get your free Trial installer, please see [Download PRTG](#)<sup>[45]</sup> section.
- **Commercial license key:** This key can only be entered if you install the Commercial Edition of PRTG, available for download in the customer service center. See [Download PRTG](#)<sup>[46]</sup> section for details. Your installation will allow the number of sensors according to your license.

### Change License Key

Usually you do not need to enter a key manually, as it is prompted during installation. However, there are still scenarios where you want to change your key, for example, when switching from a Trial Edition to a [Special Edition](#)<sup>[19]</sup>.

If you need to enter new license information, please follow these steps.

### Step 1: Make Sure You Have Installed the Correct Edition

Please check first if you have installed the proper edition and then enter the license key.

There are two different installers available for PRTG (see [Download](#)<sup>[45]</sup> section):

- The publicly available installer only contains the Freeware, Special, and Trial Editions. It does not accept any commercial license keys.
- The Commercial installer is only available for download to paying customers.

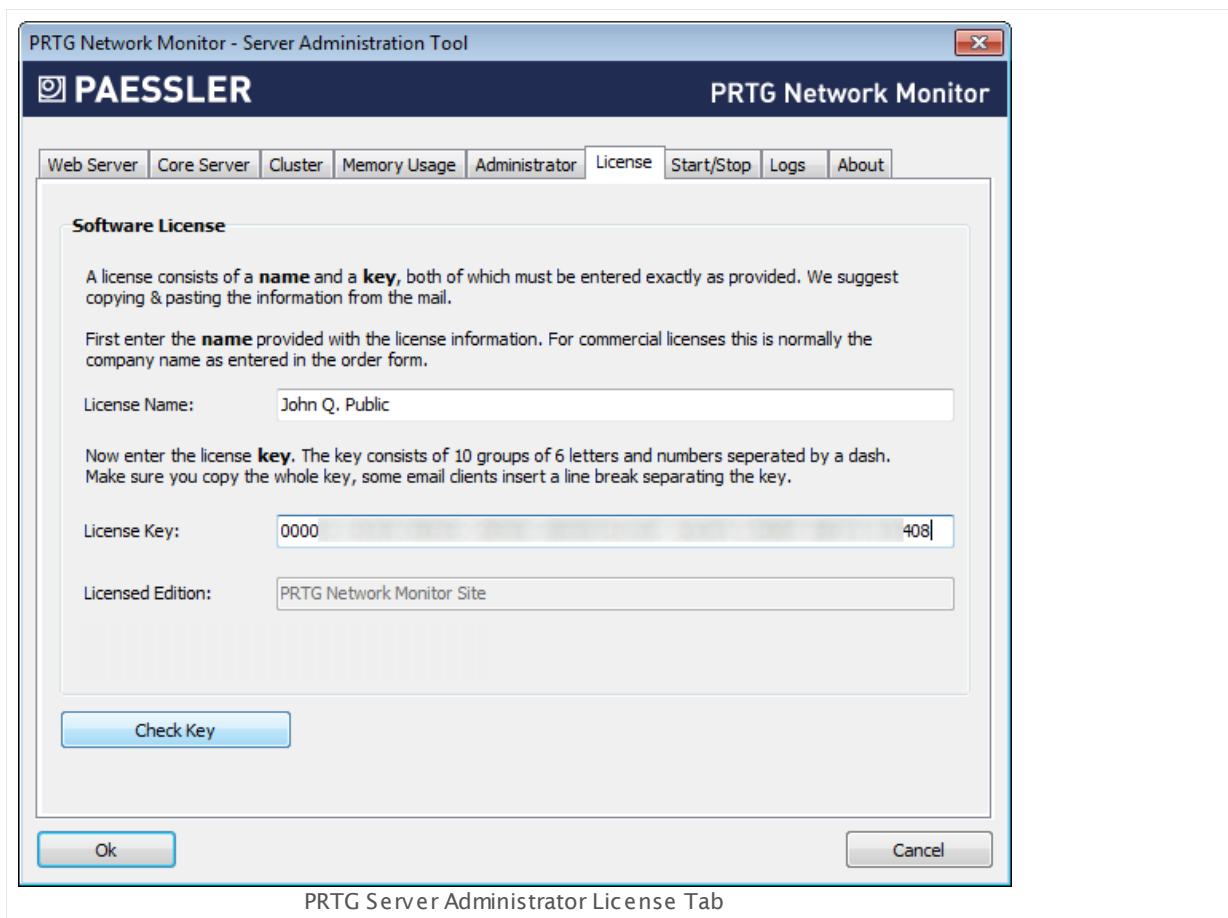

The Commercial Installer must be installed to run the commercial editions of PRTG Network Monitor. **If you have purchased a license key for PRTG, please download and install the latest Commercial Installer from the Paessler website in order to apply your license key.** **Note:** You can install a commercial version "on top" of an existing Trial Edition in order to maintain your configuration and monitoring data.

## Step 2: Enter the License Key in the PRTG Server Administrator

Please start the **PRTG Server Administrator** program from the Windows Start Menu. In the program, select the **License** tab.

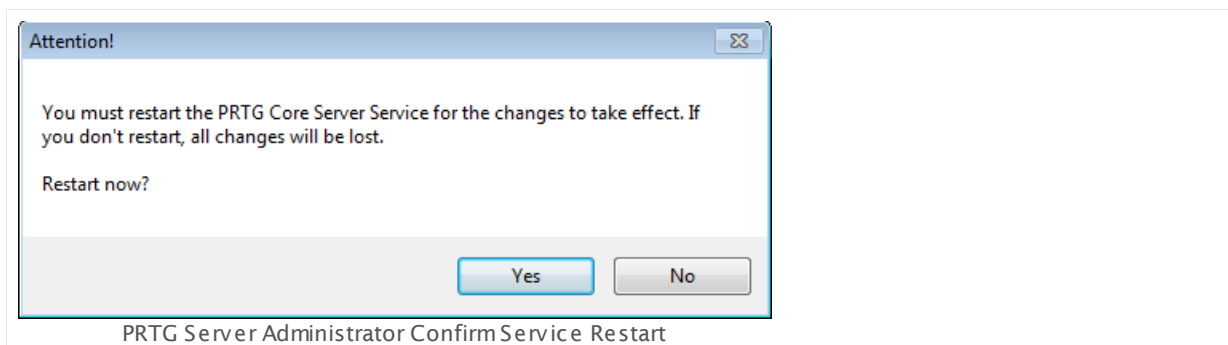

To use a PRTG license with this installation of PRTG, please enter the license information you have received from Paessler via email. To avoid typing errors, please copy and paste both the **License Name** and the **License Key** from the email. Both must be transferred exactly as shown in the email.

To make sure your key has been entered correctly please click on the **Check Key** button. A popup box will either show success or denial of your license information. License information is also checked if you change tabs.

In the **Licensed Edition** field you will see an accepted license key.

Click on the **Ok** button to save and confirm to restart the core server service by clicking on the **Yes** button.

## 3.6 Activate the Product

PRTG tries to activate your license automatically via the internet on first start up. Only if PRTG cannot connect to the internet directly, the web interface will display a **Software Activation Required** notice.

You have to run through the product activation process once in order to use PRTG continuously (only Freeware and Trial Edition are always activated automatically and do not require a special procedure). The activation has to be done within ten days after installation and only takes a few minutes. If you do not activate PRTG for ten days, it will temporarily revert to the Freeware Edition (with a maximum of 10 sensors) until you activate. [Login to the PRTG web interface](#)<sup>102</sup> to activate.

### Activate via Internet

In the PRTG web interface, choose **Setup | PRTG Status | Activation Status** from the main menu.

Click on the button **Start Activation Now** to start product activation. PRTG will now connect with the Paessler license server to check your license (via SSL on port 443). A few seconds later you should see **Activation OK** in the License Activation Status.

**Note:** The PRTG core server needs an internet connection on port 443 to activate. If a proxy connection is needed, please configure it in the [System Administration—Core & Probes](#)<sup>1849</sup> settings. Please see [More](#)<sup>61</sup> section for details about activation servers. In case activation fails, you can activate via email.

### Activate via Email

In the PRTG Web Interface, choose **Setup | PRTG Status | Activation Status** from the main menu.

If there is no internet connection available, you can activate PRTG via email. To do so, first click on the **Start Activation Now** button. You will then see **Last message about activation: Activation failed** in the License Activation Status.

- Once the activation via internet fails, the activation via email is available.
- Click on the **Start Activation per Email** tab. You will see an **Activation Request Code**.
- Copy it and send it to the email address shown.
- Within two business days you will receive an email reply from Paessler, containing an activation code.
- Once you've received this email, go the **Finalize Activation per Email** tab and copy the activation code into the according field. **Note:** Please make sure you only copy the code itself and nothing else from the email. Also, please omit the "Activation Code Start/End" markers.
- Click on **Confirm Activation**.

A few seconds later you should see **Activation OK** in the License Activation Status.

### More

Knowledge Base: Which servers does PRTG connect to for Software Auto-Update and for Activation?

- <http://kb.paessler.com/en/topic/32513>

## 3.7 Install a PRTG Remote Probe

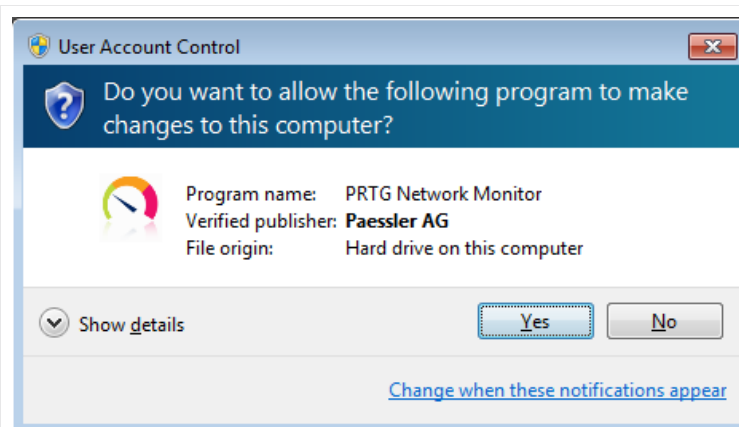

The local probe is already included in a [PRTG core server installation](#)<sup>[51]</sup>. You can install additional remote probes on other computers in order to take load from the system running the core installation or to extend monitoring to distributed networks. **Note:** You cannot install a remote probe on a system already running a PRTG core installation.

### Download Remote Probe Installer from the Web Interface

The remote probe version has to fit the PRTG core server version you will connect to. In order to download your setup program to the computer you want to install it on, please [connect to the Ajax web interface](#)<sup>[102]</sup>. On the [login screen](#)<sup>[102]</sup>, enter login name and password and from the main menu, select **Setup | Downloads / Add-Ons | Remote Probe Installer**. Click on the **Download: Remote Probe Installer** button. Your browser will show a download dialog. Save the setup program to your local hard disk drive.

### Install Remote Probe

Please execute the setup program you've just downloaded.

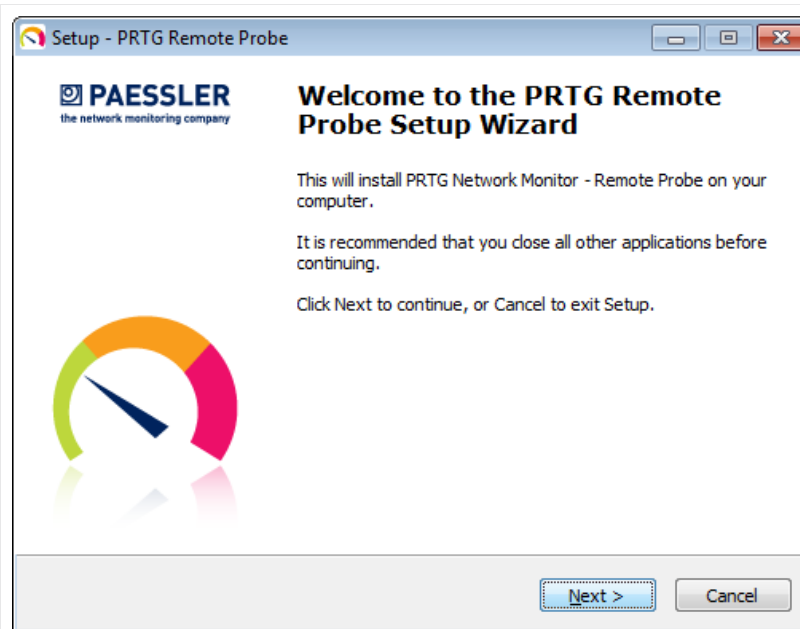

Windows User Account Control Confirmation Request

Confirm the question of the Windows User Account Control with **Yes** to allow the program to install. The usual software installation wizard will guide you through the installation process.

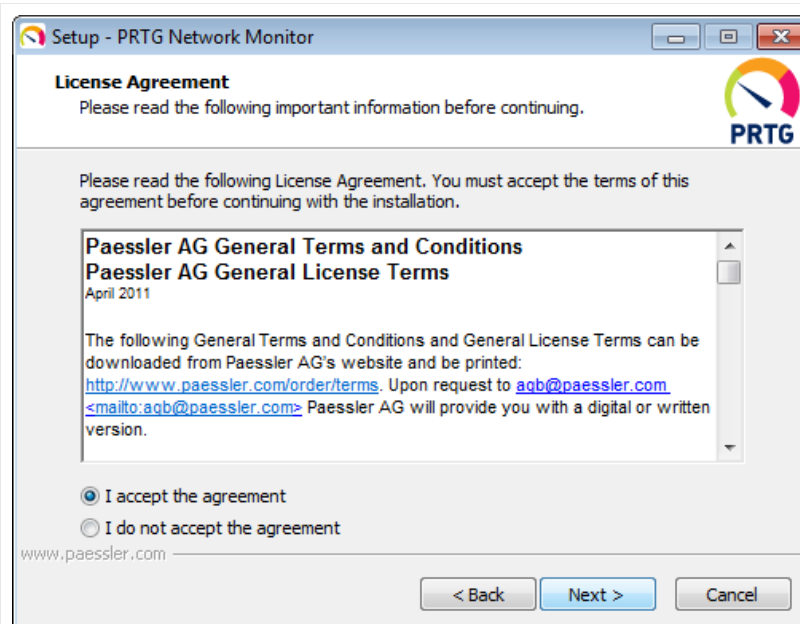

Setup Language Selection

Please select a language for your product and click the **OK** button. The available language options depend on both your Windows version and the setup file.

Remote Probe Setup Wizard Welcome Screen

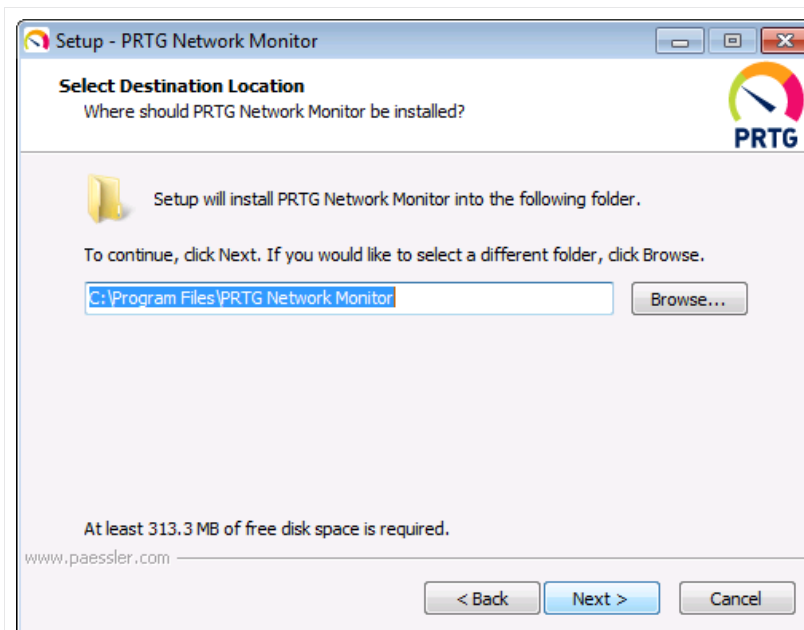

Please click **Next** to walk through the wizard.

Setup Wizard License Agreement

After accepting the license agreement, you can choose the folder you wish to install the software in. We recommend using the default value.

## Part 3: Installing the Software | 7 Install a PRTG Remote Probe

Setup Wizard Destination Location

As soon as you click **Next**, the necessary files will be copied to your disk.

Windows GUI Setup Wizard Install

The PRTG Probe Administrator is shown. Please enter the correct settings in order to connect with your PRTG core installation. See [Remote Probe Setup](#) <sup>2059</sup> section for more information. Click **Ok** to continue.

PRTG Network Monitor - Probe Administration Tool

PAESSLER PRTG Network Monitor

Probe Settings | Outgoing IP Settings | Start/Stop | Logs / Directory | About

**Probe Settings**

**Language**

English

Ok Cancel

Probe Settings in PRTG Probe Administrator

When asked if you want to start the probe service, confirm with **Yes**. The installation is completed.

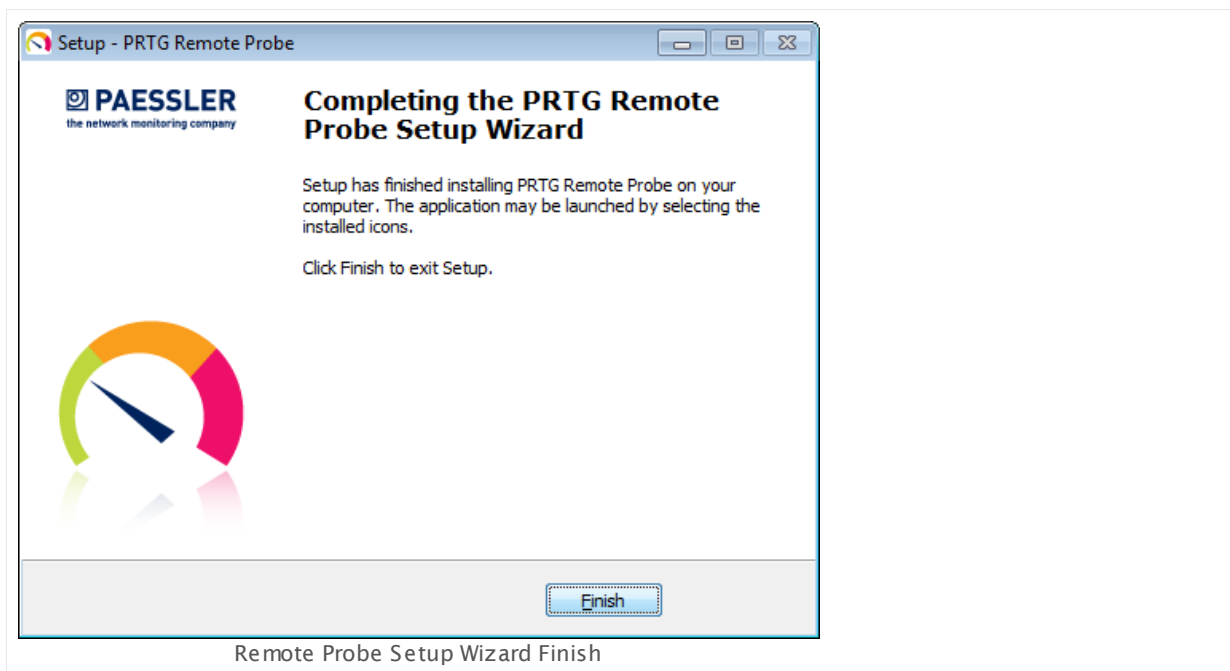

Attention!

The PRTG 8 Probe Service is not running. Do you wish to start it?

Yes No

PRTG Probe Administrator Start Service Request

After installation, click **Finish**.

Your remote probe is now installed on this computer as Windows service.

## More

After you click the **Finish** button, the PRTG Probe Administrator is shown, allowing you to configure connections. Please see section [Remote Probe Setup](#)<sup>[2059]</sup> for more information on how to connect the remote probe with your PRTG core server installation.

Note: You can also install a Remote Probe directly from PRTG's web interface. For details, refer to [Remote Probe Quick Install](#)<sup>[2053]</sup>.

## 3.8 Install the Enterprise Console

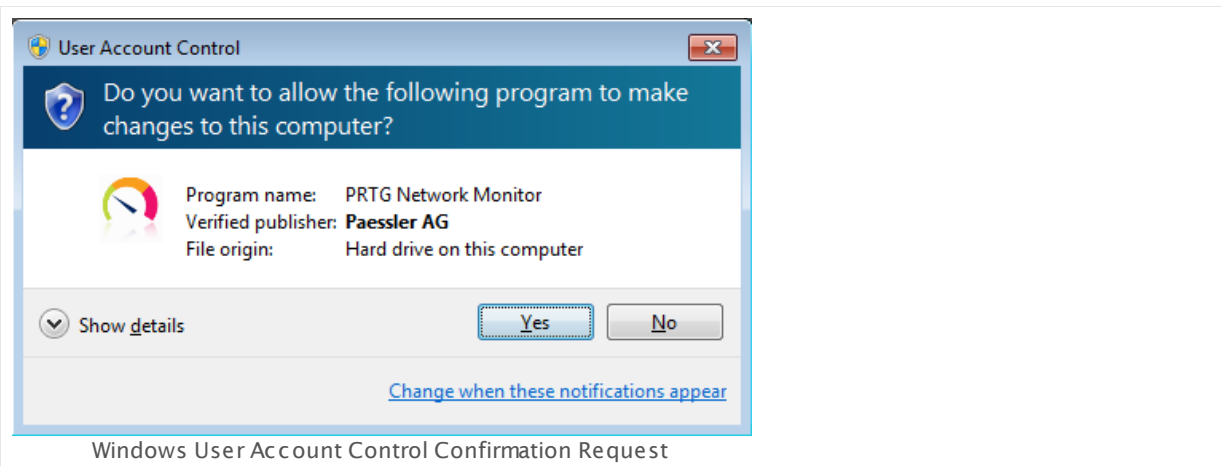

The Enterprise Console is already included in a [PRTG core server installation](#)<sup>[51]</sup>. You can install additional Enterprise Consoles on other computers.

### Download Enterprise Console from the Web Interface

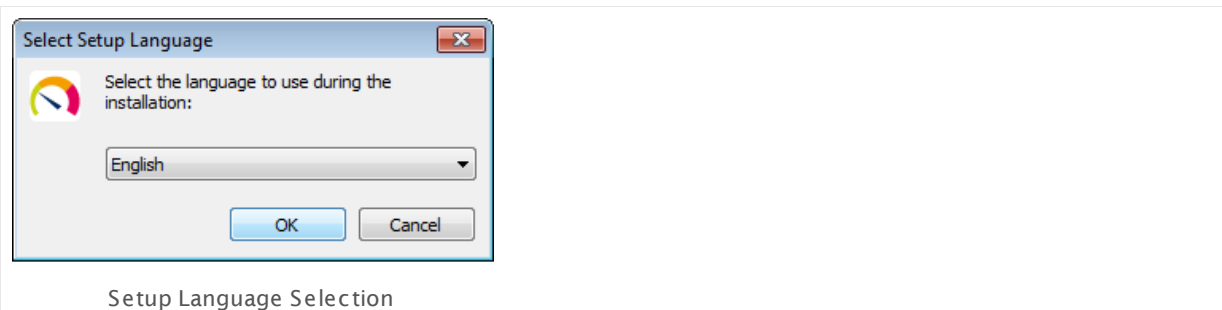

The version of the Enterprise Console has to fit exactly the PRTG core server version you will connect to. From the computer you want to install the Enterprise Console on, please connect to the [Ajax](#)<sup>[100]</sup> web interface. On the [login screen](#)<sup>[102]</sup> of the web interface, enter login name and password and select the **Enterprise Console (Download for Windows)** option. Your browser will show a download dialog. Save the setup program to the local hard disk drive.

### Install Enterprise Console

Please execute the setup program you just have downloaded.

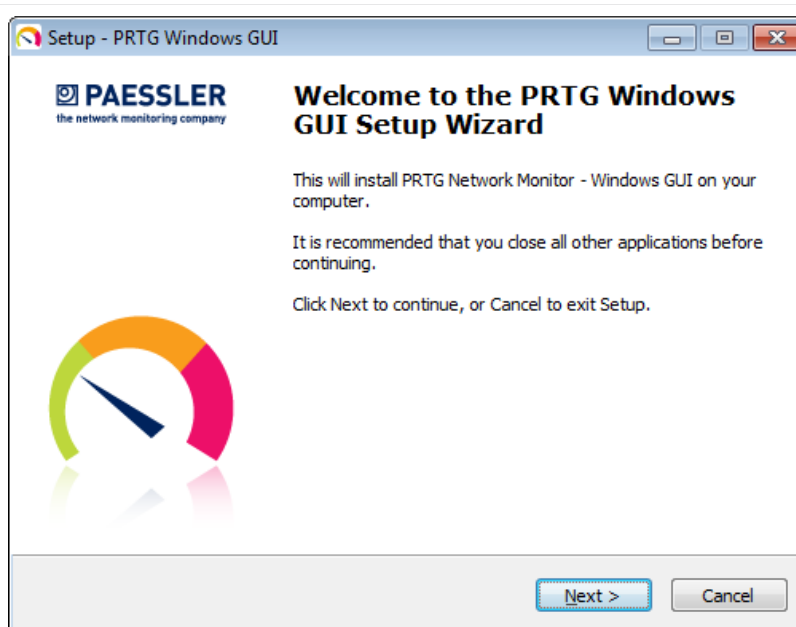

Confirm the question of the Windows User Account Control with **Yes** to allow the program to install. The usual software installation wizard will guide you through the installation process.

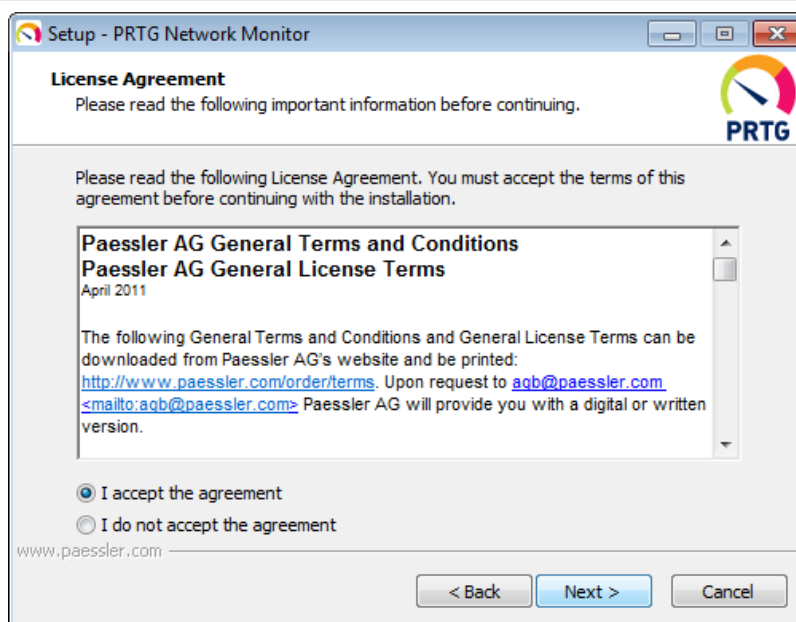

Please select a language for your product and click the **OK** button. The available language options depend on both your Windows version and the setup file.

## Part 3: Installing the Software | 8 Install the Enterprise Console

Windows GUI Setup Wizard Welcome Screen

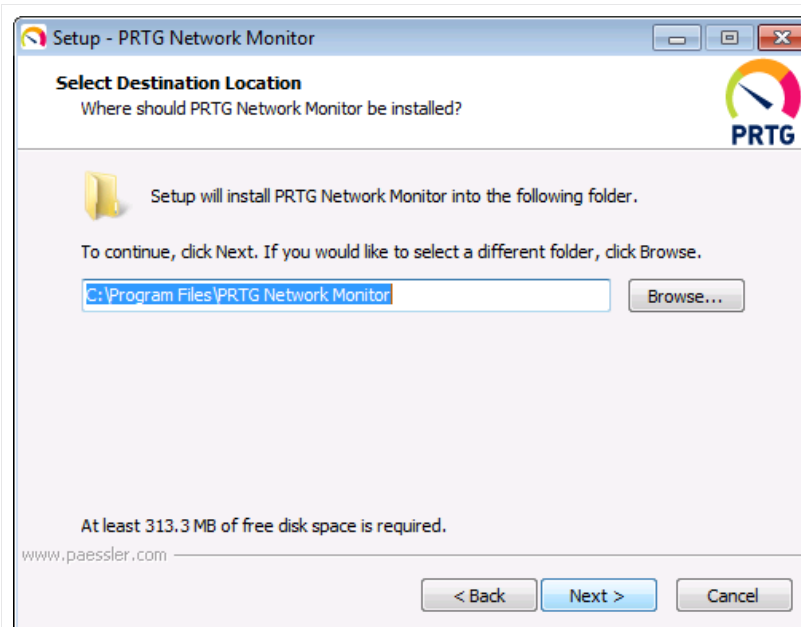

Please click **Next** to walk through the wizard.

Setup Wizard License Agreement

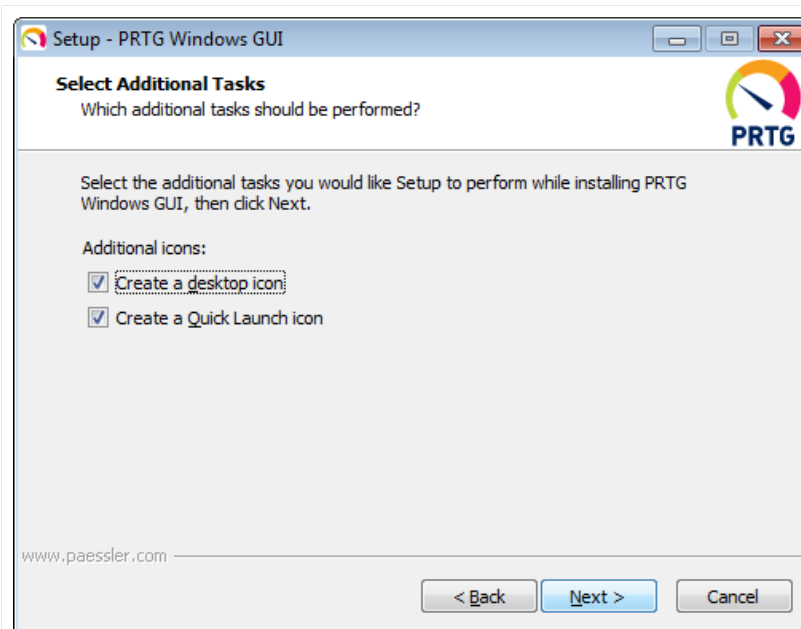

After accepting the license agreement, you can choose the folder you wish to install the software in. We recommend using the default value.

Setup Wizard Destination Location

Select which icons will be created. We recommend using the default value.

Windows GUI Setup Wizard Additional Tasks

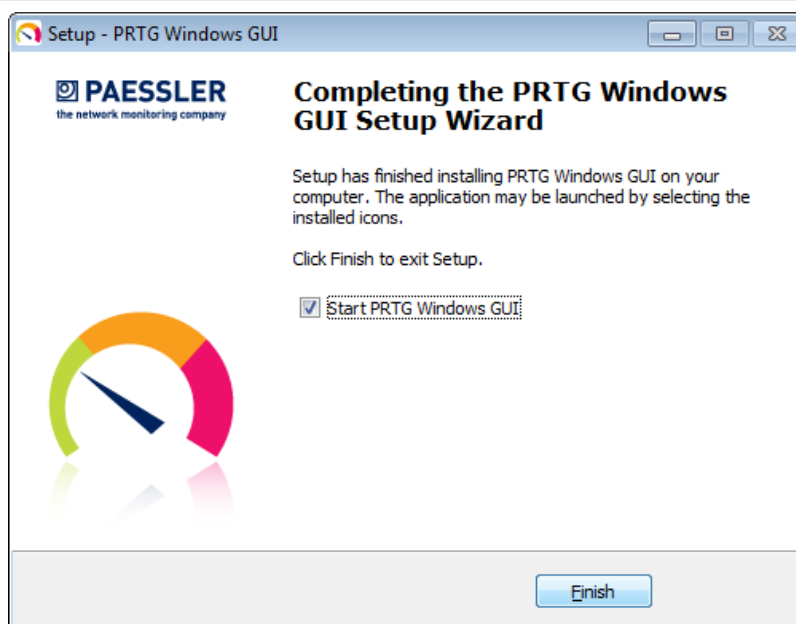

As soon as you click **Next**, the necessary files will be copied to your disk.

After installation, click **Finish** to start the Enterprise Console.

Windows GUI Setup Wizard Finish

## More

Please see section [Enterprise Console](#) <sup>1894</sup> for more information on how to use this Graphical User Interface (GUI).

## 3.9 Uninstall PRTG Products

The uninstall process has six steps—regardless of if you are uninstalling an entire PRTG Network Monitor installation, a single Enterprise Console installation, or a PRTG Remote Probe installation. Use the Windows uninstall routines to remove the PRTG software from your system.

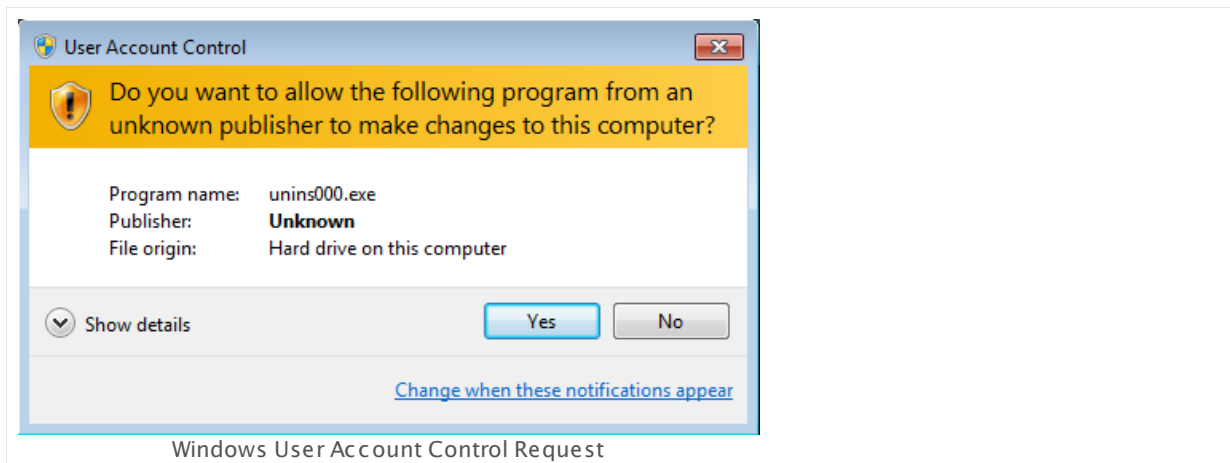

### Step 1

From the Windows Start Menu, select the **Uninstall PRTG Network Monitor** icon, the **Uninstall PRTG Enterprise Console** icon, or the **Uninstall PRTG Remote Probe** icon, or open your Windows Control Panel and choose the respective entry in the **Programs** section. Depending on the installed products, not all uninstall programs are available.

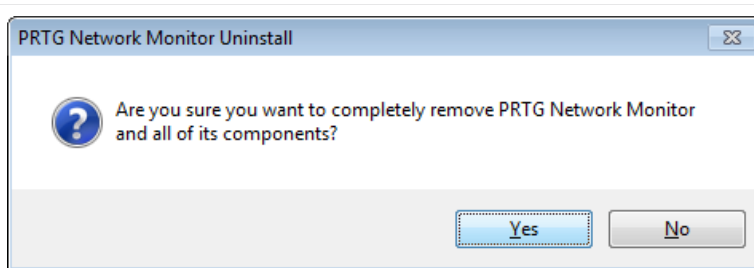

### Step 2

If asked, confirm the question of the Windows User Account Control with **Yes** to allow the program to uninstall. The usual software uninstall wizard will guide you through the uninstall process.

### Step 3

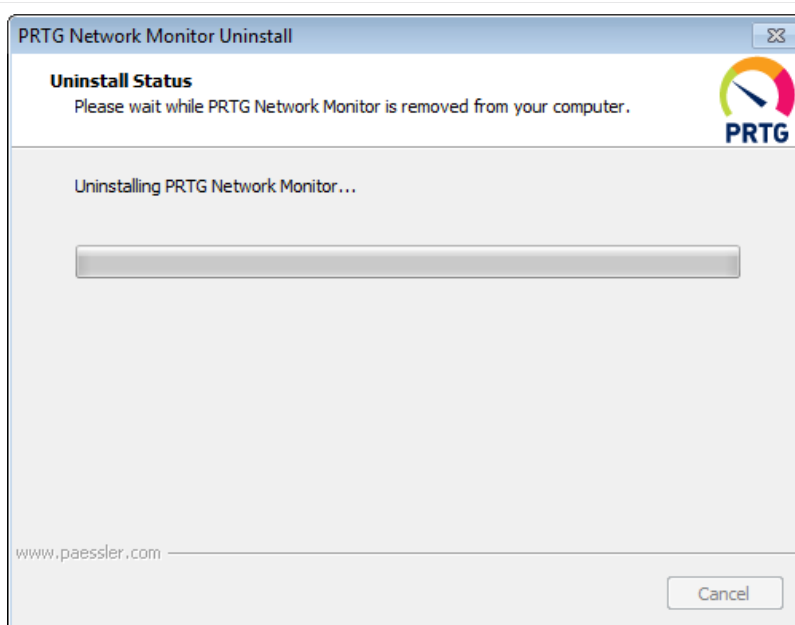

Confirm the removal of the software by clicking the **Yes** button.

Uninstall PRTG Network Monitor Step 1

## Step 4

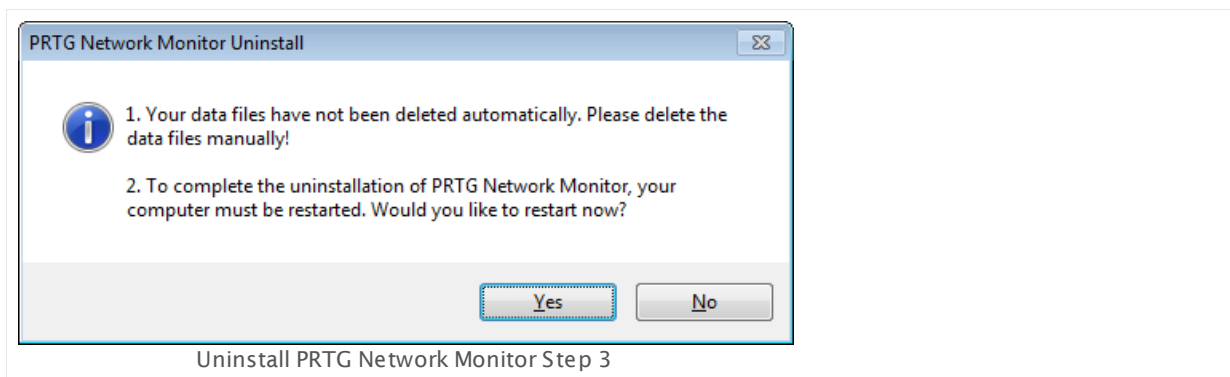

Wait while the software is being removed.

Uninstall PRTG Network Monitor Step 2

## Step 5

Confirm a system restart by clicking the **Yes** button.

## Step 6

After system restart, the software is removed. However, there are still custom data in the PRTG program folder left. If you have uninstalled an entire PRTG Network Monitor installation or a remote probe installation, your monitoring data is still stored on the system. To completely remove all PRTG data, please delete the **PRTG Network Monitor** program folder as well as the **Paessler\PRTG Network Monitor** folder in your data path. For more information where data is stored see [Data Storage](#) 2074 section.

# Part 4

## Understanding Basic Concepts

## 4 Understanding Basic Concepts

There are a number of basic concepts that are essential for understanding the functionality and ease of use of PRTG Network Monitor. We have made using our software as easy as possible; setting it up for the first start and getting first monitoring results happens almost automatically. Nevertheless, there are some basic principles we would like to explain to you. Please read this section carefully to understand the underlying workflow like architecture of the monitoring system, hierarchy of objects, settings inheritance, notifying, etc. Afterwards, you will be able to enhance your monitoring experience permanently.

### Understanding Basic Concepts—Topics

- [Architecture and User Interfaces](#) <sup>77</sup>
- [Clustering](#) <sup>81</sup>
- [Object Hierarchy](#) <sup>83</sup>
- [Inheritance of Settings](#) <sup>87</sup>
- [Tags](#) <sup>89</sup>
- [Dependencies](#) <sup>90</sup>
- [Scheduling](#) <sup>91</sup>

- [Data Reporting](#) <sup>93</sup>
- [User Access Rights](#) <sup>94</sup>
- [IPv6](#) <sup>97</sup>

## 4.1 Architecture and User Interfaces

PRTG Network Monitor consists of different parts which can be divided into three main categories: System parts, control interfaces, and basic administration interfaces.

Type	Part of PRTG
System Parts	<a href="#">Core Server</a> <sup>781</sup> This is the central part of a PRTG installation and includes data storage, web server, report engine, a notification system, and more. The core server is configured as Windows service which runs permanently.
	<a href="#">Probe(s)</a> <sup>781</sup> The part of PRTG on which the actual monitoring is performed. There are local probes, remote probes, and cluster probes available. All monitoring data is forwarded to the central core server. Probes are configured as Windows services which run permanently.
User Interfaces	<a href="#">Ajax Web Interface</a> <sup>1001</sup> The Ajax-based web interface is used for configuration of devices and sensors, as well as the review of monitoring results. Also system administration and user management are configured here.
	<a href="#">Enterprise Console</a> <sup>1894</sup> A native Windows application (former Windows GUI) as alternative to the web interface to manage your monitoring. With the Enterprise Console, you can connect to different independent PRTG core server installations and review their data at a glance!
	<a href="#">Mobile Web GUI</a> <sup>1947</sup> A read-only interface optimized for mobile access to your PRTG installation. View latest states, tables, and graphs. Using jQuery Mobile, this interface is compatible with almost all mobile devices available on the market, as well as with older and unsupported browser versions.
	<a href="#">Smart Phone Apps</a> <sup>1950</sup> Monitor your network on the go with PRTG and apps for iOS and Android devices.
System Administration Programs	<a href="#">PRTG Server Administrator</a> <sup>1990</sup> Used to configure basic core server settings, such as administrator login, web server IPs and port, probe connection settings, cluster mode, system language, and more.

Type	Part of PRTG
	<a href="#">PRTG Probe Administrator</a> <sup>2016</sup> Used to configure basic probe settings such as name of the probe, IP and server connection settings, and more.

## Core Server

The core server is the heart of your PRTG system and performs the following processes:

- Configuration management for object monitoring
- Management and configuration of the connected probes
- Cluster management
- Database for monitoring results
- Notification management including a mail server for email delivery
- Report generator and scheduler
- User account management
- Data purging (culling data that is older than 365 days, for example)
- Web server and API server

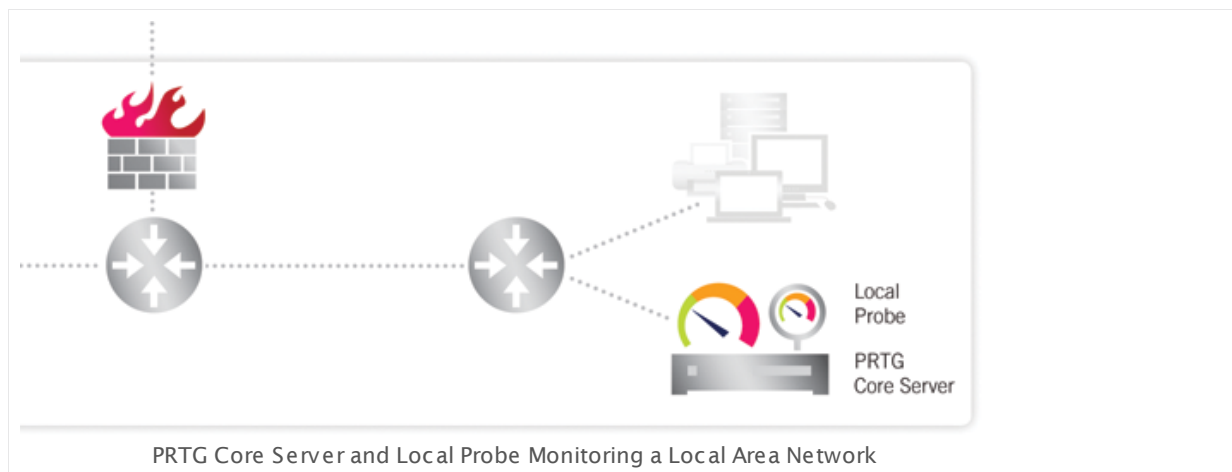

In a [cluster](#)<sup>81</sup>, the current master node is responsible for all of these tasks.

The built-in, fast, and secure web server (no additional IIS or Apache is required) supports HTTP as well as secure HTTPS (via SSL). It serves the web interface when accessed with a browser and also answers PRTG Application Programming Interface (API) calls (for example, for user scripts or the Enterprise Console).

**Note:** Core server and probe(s) are configured as Windows services which are permanently run by the Windows system without the requirement for a logged-in user.

## Probe(s)

On a probe, PRTG performs the actual monitoring with the sensors created on a device (for example, computer, router, server, firewall, etc.). The probe receives its configuration from the core server, runs the monitoring processes, and delivers monitoring results back to the core server. On every system running a PRTG core server, there is always a local probe running with it on the same machine.

The actual monitoring is performed by PRTG probe processes which run on one or more computers. During installation, the system automatically creates the so-called **Local Probe**. In a single-probe installation—which is the default setup—the local probe performs all monitoring.

The PRTG core server inside the corporate LAN (bottom right in the figure above) is able to monitor services and servers in the entire Local Area Network (LAN). **Note:** Core server and probe(s) are configured as Windows services which are permanently run by the Windows system without the requirement for a logged-in user.

In a [cluster setup](#)<sup>[81]</sup>, a cluster probe runs on all nodes. There is an additional so-called **Cluster Probe**. All devices created on it are monitored by all nodes in the cluster, so data from different perspectives is available and monitoring for these devices always continues, also if one of the nodes fails.

PRTG automatically monitors system health of its own core server and of each probe in order to discover overloading situations that may distort monitoring results. To monitor the system status of the probe computer, PRTG automatically creates a few sensors. These include **Core** and **Probe Health**, **System Health**, **Cluster Probe Health**, **Disk Free**, and a bandwidth sensor for all installed network cards. We recommend keeping these sensors, but you can optionally remove all except the **Health** sensors. They measure various internal system parameters of the probe system hardware and the probe's internal processes and then computes a resulting value. Frequent or repeated values below 100% should be investigated. Please check the [channels](#)<sup>[124]</sup> of a particular sensor for details.

Additional so-called **Remote Probes** can be created by the user in order to achieve monitoring of multiple locations, or for several other scenarios. They are using SSL-secured connections to the core and allow to securely monitor services and systems inside remote networks which are not openly accessible or secured by firewalls. For more information, please see [Remote Probes and Multiple Probes](#)<sup>[209]</sup> section. For a video on this please see [More](#)<sup>[203]</sup> section below.

Video Tutorial: There is a video available on the Paessler video tutorials page.

- [http://www.paessler.com/support/video\\_tutorials](http://www.paessler.com/support/video_tutorials)

## 4.2 Clustering

A PRTG Cluster consists of two or more [installations of PRTG](#)<sup>[51]</sup> that work together to form a high availability monitoring system. The objective is to reach true 100% uptime for the monitoring tool. Using [clustering](#)<sup>[2004]</sup>, the uptime will no longer be degraded by failing connections because of an internet outage at a PRTG server's location, failing hardware, or because of downtime due to a software update for the operating system or PRTG itself.

### How a PRTG Cluster Works

A PRTG cluster consists of one **Primary Master Node** and one or more **Failover Nodes**. Each node is simply a full installation of PRTG which could perform the whole monitoring and alerting on its own. Nodes are connected to each other using two TCP/IP connections. They communicate in both directions and a single node only needs to connect to one other node to integrate into the cluster.

During normal operation the **Primary Master** is used to configure devices and sensors (using the [web interface](#)<sup>[100]</sup> or [Enterprise Console](#)<sup>[1894]</sup>). The master automatically distributes the configuration to all other nodes in real time. All nodes are permanently monitoring the network according to this common configuration and each node stores its results into its own database. This way, the storage of monitoring results also is distributed among the cluster (the downside of this concept is that monitoring traffic and load on the network is multiplied by the number of cluster nodes, but this will not be a problem for most usage scenarios). The user can review the monitoring results by logging into the web interface of any of the cluster nodes in read only mode. Because the monitoring configuration is centrally managed, it can only be changed on the master node, though.

By default, all devices created on the **Cluster Probe** are monitored by all nodes in the cluster, so data from different perspective is available and monitoring for these devices always continues, even if one of the nodes fails. In case the **Primary Master** fails, one of the **Failover Nodes** takes over the master role and controls the cluster until the master node is back. This ensures a fail-safe monitoring with gapless data. **Note:** During the outage of a node, it will not be able to collect monitoring data. The data of this single node will show gaps. However, monitoring data for this time span is still available on the other node(s). There is no functionality to actually fill in other nodes' data into those gaps.

If downtimes or threshold breaches are discovered by one or more nodes, only one installation, either the Primary Master or the Failover Master, will send out notifications (via email, SMS text message, etc.). Thus, the administrator will not be flooded with notifications from all cluster nodes in case of failures.

### Set Up a PRTG Cluster

For detailed information, please see [Failover Cluster Configuration](#)<sup>[2004]</sup>.

### More

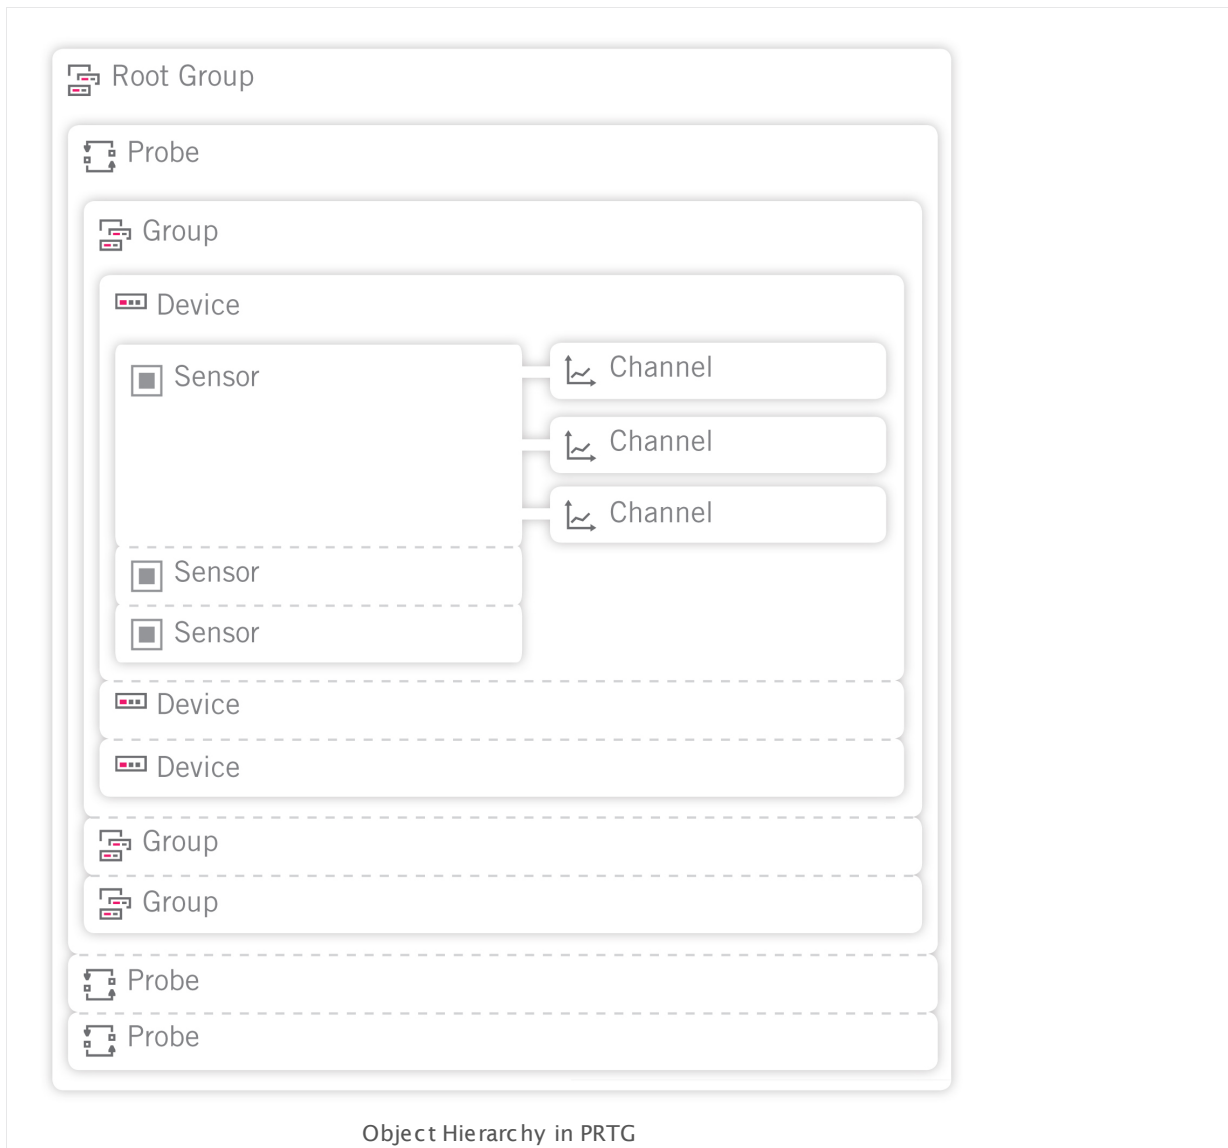

Knowledge Base: What's the Clustering Feature in PRTG?

- <http://kb.paessler.com/en/topic/6403>

## 4.3 Object Hierarchy

All objects in a PRTG monitoring configuration are arranged in a tree-like hierarchy to create an easy to navigate list and to give the user the possibility to arrange them in groups that monitor similar devices, services, or same locations. The hierarchical order described is also used to define common settings for larger groups of objects, for example, settings of the **Root** group apply by default to all other objects underneath (see section [Inheritance of Settings](#)<sup>[87]</sup>).

The figure shows the object hierarchy in PRTG:

- **Root** group contains all objects in your setup; all probes are directly under the root node.
- A **Probe** contains one or more groups.
- A **Group** contains one or more devices.

- A **Device** represents one component in your network which is reachable via an IP address. On a device are several sensors.
- A **Sensor** monitors one single aspect of a device and has at least one channel.
- A **Channel** receives the monitoring results and is part of a sensor.

## Root Group

The **Root** group is the topmost instance in PRTG. It contains all other objects in your setup. Using the [inheritance](#)<sup>[87]</sup> mechanism, we recommend [adjusting the default settings for the Root group](#)<sup>[224]</sup>. This makes configuration easier later on, because all other objects inherit these standard settings by default and, thus, you will not have to set up the same configuration for each object anew.

## Probe

Each group (except the **Root** group) is part of a **Probe**. This is the platform on which the monitoring takes place. All objects configured below a probe will be monitored via that probe. Every PRTG core installation automatically installs a **Local Probe** service. You can add additional probes and remote probes to your configuration to include remote devices from outside your network into the monitoring (see section [Multiple Probes and Remote Probes](#)<sup>[2048]</sup>). In a cluster, there is an additional **Cluster Probe** running on all nodes. Devices on the cluster probe are monitored by all nodes of the cluster, so data from a different perspective is available and monitoring for these devices will always continue, even if one of the nodes fails.

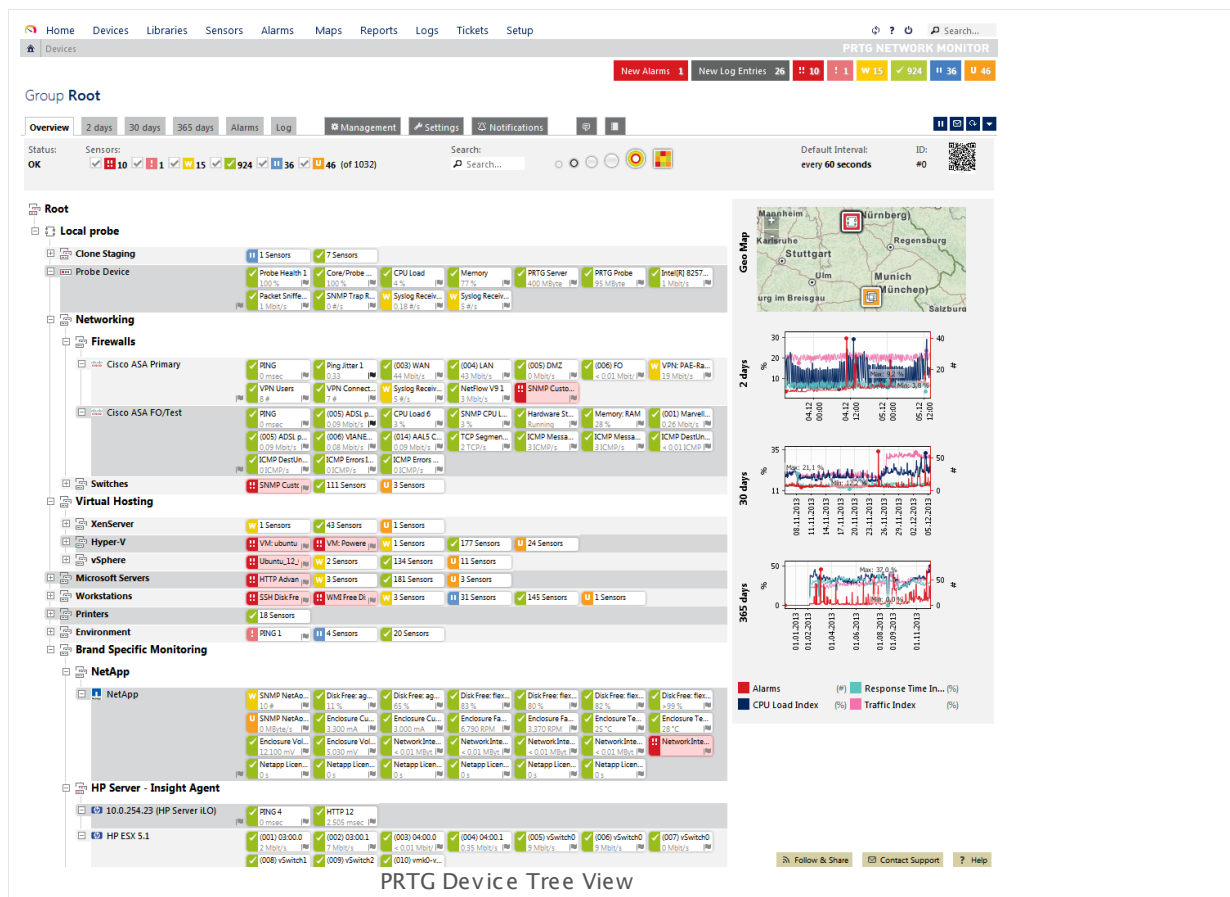

## Group

On each probe, there are one or more **Groups**, which serve merely structural purposes. Use groups to arrange similar objects in order to inherit same settings to them. To a group, you add the devices. You can arrange your devices in different nested groups to reflect the structure of your network.

Find below a sample configuration: A device tree with local probe, several groups, devices and their sensors.

## Part 4: Understanding Basic Concepts | 3 Object Hierarchy

## Device

To each probe or group, you can add **Devices** that you want to monitor. Each device in your PRTG configuration represents a real hardware or virtual device in your network. These can be, for example:

- Web or file server
- Client computer (Windows, Linux, or Mac OS)
- Router or network switch
- Almost every device in your network that has its own IP address

**Note:** Sometimes you may want to add the same device in PRTG several times, in order to get a better overview when using many sensors for a very detailed monitoring, or to use different device settings for different groups of sensors. In PRTG you can simply add multiple devices with the same IP address or DNS name. The sensors on all of these PRTG devices will then query the same real hardware device in your network.

PRTG additionally adds a so called **Probe Device** to the local probe. This is an internal system device. It has access to the computer on which the probe is running on and monitors its health parameters with several sensors running on it.

## Sensor

On each device you can create a number of **Sensors**. Every sensor monitors one single aspect of a device. This can be, for example:

- One network service like SMTP, FTP, HTTP, etc.
- One network switch port's traffic
- CPU load of a device
- Memory load of a device
- Traffic on one network card
- One NetFlow device
- System health of a device
- Other content (for example, of databases, mails, HTTP, XML, files, etc.)
- etc.

## Channel

Every sensor has a number of **Channels** through which it receives the different data streams. The available channels depend on the type of sensor. One sensor channel can contain, for example:

- **Downtime** and **uptime** of a device
- **Traffic in** of a bandwidth device (for example, a router)
- **Traffic out** of a bandwidth device (for example, a router)
- **Traffic sum** of a bandwidth device (for example, a router)
- **WWW traffic** of a NetFlow device
- **Mail traffic** of a NetFlow device
- **Other traffic** of a NetFlow device
- **CPU load** of a device
- **Loading time** of a web page
- **Download bandwidth** of a web page
- **Time to first byte** of a web page
- **Response time** of a Ping request to a device
- **Response time** of a Remote Desktop service
- etc.

## 4.4 Inheritance of Settings

The [hierarchical tree](#)<sup>[83]</sup> is not only used to group sensors for organizational reasons, there is also an important aspect involved that we call **inheritance**. To ensure administration is quick and easy—especially for large monitoring setups—certain settings are inherited from the overlying level. For example, you can change the monitoring interval for all sensors by editing the interval setting of the topmost **Root** group (unless no other setting is defined below).

### Settings are Inherited to Child Objects

You can override this inheritance on any level of the hierarchy by setting a different value for a specific probe, group, device, or sensor. All objects below will inherit these new settings; object settings from levels above will stay unchanged.

Settings that are inherited among all objects include:

- Monitoring interval
- Notification triggers
- Authentication settings for several systems
- Compatibility settings (for certain types of sensors)
- Channel and unit configuration
- [User access rights](#)<sup>[94]</sup>
- [Tags](#)<sup>[89]</sup>
- Paused status: If an object is paused by the user, or a schedule, all sensors on it are paused as well
- etc.

There is one exception for devices and sensors: The **IP address** or **DNS name** of a device and compatibility settings are always inherited by sensors and can not be changed on sensor level.

The actual overriding of the parent's settings takes place in an object's settings: Remove the check mark symbol at the beginning of the respective line **inherit from [parent object]**. For example, the screenshot below shows Windows systems credentials settings after removing the check mark symbol.

CREDENTIALS FOR WINDOWS SYSTEMS

☐ inherit from User Group home (Domain or Computer Name: paessler, Username: ...)

Domain or Computer Name

Username

Password

Credentials for Windows Systems

## Default Values Set in Root Group

For all settings (except passwords), PRTG already includes a set of default values so you can get started with the software immediately. For example, the following settings will be inherited by all sensors from the **Root** group:

- Default monitoring interval of one minute
- SNMP version 1 with community string set to **public** (default values for most devices)
- Dependency type **Use parent**
- etc.

You may need to change some of the default entries as you become used to the interface. However, these settings will initially suffice for most situations.

Before sensor setup, please review the **Root** group's settings and set the default values to suit your setup, including necessary credentials for all kinds of systems in your network you want to monitor (Windows, Linux, virtual servers, etc.).

See section [Root Group Settings](#)<sup>224</sup> for more details.

## Inheritance of Notification Triggers

If you add notification triggers on probe, group, or devices level, these will also be inherited to all sensors underneath, unless you cancel inheritance with specific settings.

See section [Sensor Notifications Settings](#)<sup>1716</sup> for details.

## 4.5 Tags

For every object in your PRTG setup, you cannot only name objects, but also define tags in an [object's settings](#)<sup>[142]</sup> to additionally mark an object as a member of certain categories. Although there are tags predefined when [adding objects](#)<sup>[204]</sup>, you are completely free in the way you add tags. For example, you can mark all of the bandwidth sensors which are especially important for you with the tag **bandwidth\_important**. Later, you can view lists of objects with certain tags (helpful for [multi-edit](#)<sup>[1736]</sup> of settings), or choose sensors by tag when creating [reports](#)<sup>[1775]</sup>. A clever arrangement of tags can save you a lot of time at some point. **Note:** You can also change tags for several objects at a time using the [multi-edit](#)<sup>[1736]</sup> function.

**BASIC SENSOR SETTINGS**

Sensor Name: (001) Ethernet Interface

Tags: bandwidthsensor X snmptrafficsensor X **disk**

Priority: ★★★★★

**TRAFFIC SPECIFIC**

Interface number: 1:Uplink .38 Port 15

[View and Edit Tags in Basic Sensor Settings](#)

### Tags Are Inherited

The tags in an object's settings are automatically [inherited](#)<sup>[87]</sup> to all other objects further down in the hierarchy. So, for example, a device with the tag **myExampleTag** will automatically and invisibly inherit this tag to all sensors created on it. This will not be visible in the sensor's tag settings, but the sensors will appear in the list whenever you search for **myExampleTag**. This is useful, for example, when adding sensors by tag in [reports](#)<sup>[1775]</sup> settings. This way, in order to configure your setup for fetching all sensors on a device by tag, you do not have to tag every single sensor, but it is enough to tag the device. Inheritance for tags cannot be disabled.

## 4.6 Dependencies

Using dependencies, you can pause sensor monitoring based on the status of another sensor in order to avoid false alarms and incorrect downtime recording. A dependency stops the monitoring of one sensor or a set of sensors as soon as a specific sensor is not in an **Up** status. This means, for example, you can stop monitoring remote network services when the corresponding firewall is down due to connection problems.

When using the [auto-discovery](#)<sup>[190]</sup> function, the **Ping** sensor on a device is by default set as the master object for this device. This means that monitoring for the entire device is paused if the Ping sensor is in a **Down** status. Usually, it does not make sense to monitor other aspects of a device with other sensors, while the **Ping** sensor indicates that the device is not even reachable.

In order to view a list of all dependencies or only selected dependencies, choose **Devices | Dependencies** from the [main menu](#)<sup>[176]</sup>.

For more information about the dependency settings, please see the [settings of the respective object](#)<sup>[142]</sup> you want to set a dependency for.

## 4.7 Scheduling

Using schedules, monitoring of an object can be [paused](#)<sup>162</sup> for a certain time, for example, Sundays between 4 and 8 a.m. A paused sensor will not collect monitoring data, will not change its status, and will not trigger any [notifications](#)<sup>92</sup>. With schedules you can limit the monitoring time automatically. You can also pause monitoring for planned system maintenance time spans to avoid false alarms. You can apply different schedules to every object. They are also used for reports and notifications.

**SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW**

☐ inherit from  Switches

Dependencies, schedules and maintenance windows always pause all sensors inside a group/device. This pausing is always inherited to all sub-objects and the inheritance can not be disabled. Below you can set additional schedules, maintenance windows or dependencies that will be used on top of any inherited setting.

Schedule	None
Maintenance Window	None
Dependency Type	Weekdays Eight-To-Eight (8:00 - 20:00) [GMT+0200]
Delay (Seconds)	Weekdays Nights (17:00 - 9:00) [GMT+0200]

Available Default Schedules in Device Settings

Schedules are user account specific. To change the default pre-defined schedules or to add your own schedule, please see [Account Settings—Schedules](#)<sup>1827</sup> section.

**Note:** If you use failover clustering with nodes in different timezones, scheduling applies at the local time of each node. For more information, please see section [Failover Cluster Configuration—Before Getting Started](#)<sup>2064</sup>.

## 4.8 Notifying

PRTG Network Monitor keeps the administrator or other responsible persons informed about the current status of the network. There are several methods how the administrator can stay up to date.

### Notifications

This is the most powerful information tool. Whenever PRTG discovers downtime, an overloaded system, threshold breach (for example, a disk runs full), or similar situations, it can send a notification. Notifications use various methods by which you can be notified (for example, email, SMS, pager message, and others). After creating notifications in the system settings, you can select them on the notifications tab of probes, groups, devices, and sensors, as well as on the root group. See [Notifications](#)<sup>[1746]</sup> section for more details.

### Limits

In a [sensor channel's settings](#)<sup>[1709]</sup>, you can set limits to change the status of the sensor when certain limits are breached. This way, you can set, for example, a traffic sensor (typically never in a error status) to **Down** status whenever bandwidth values are measured that you consider critical. This sensor will then show up in the alarms list.

### Alarms

The alarms list shows all sensors that are currently in a **Down**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. This is useful to keep track of all irregularities in your network. In the table list, you can re-sort the items by clicking on the column's header items. See [Alarms](#)<sup>[144]</sup> section for more details.

### Logs

In the logs list, the log file with all monitoring events is shown. In a typical setup, a huge amount of data is produced here. As the activity of every single object is minuted, you can use this data to check exactly if your setup works as expected. See [Logs](#)<sup>[147]</sup> section for more information.

### Tickets

The tickets list shows items with important system information or action steps to take for the administrator. You should view every ticket and take appropriate actions. Per default, an email is sent to the administrator for every new ticket that is created by the system or another user. If a ticket is assigned to a specific user, this user will get an email by default. See [Tickets](#)<sup>[149]</sup> section for more information.

## 4.9 Data Reporting

With [Reports](#)<sup>[1775]</sup> you can analyze and review monitoring data for specific time spans. There are several ways to create data reports in PRTG for your individual needs.

### View Historic Data

To get a report for a single sensor, there is a function included to review historic data in PRTG. It allows you to generate reports and charts for a single sensor's data. See [Historic Data Reports](#)<sup>[133]</sup> section for more information.

### Generate Reports

You can use the sophisticated reports machine included in PRTG to create exhaustive reports for all monitoring data. See [Reports](#)<sup>[1775]</sup> section for more information.

### Export Data Using the API

You can also export all monitoring raw data to XML or CSV files and generate your own reports using any third party software. See [Using the PRTG API \(Application Programming Interface\)](#)<sup>[2031]</sup> section for more information.

### Make Data Available

You can make monitoring data available to other persons using a special user with read-only rights (see [User Access Rights](#)<sup>[94]</sup> section), or you can create public or semi-public HTML pages with monitoring data using the Maps feature. See [Maps](#)<sup>[1794]</sup> section for more information.

### Bill Customers

You can also create custom billing reports based on PRTG's monitoring data, using the open source **Billing Tool** for PRTG. For details and download, please see [More](#)<sup>[93]</sup> section below.

### More

- [Data Storage](#)<sup>[2074]</sup>

Paessler Website: Billing Tool

- <http://www.paessler.com/tools/billingtool>

## 4.10 User Access Rights

The default administrator can use the PRTG installation as the only user or can create an unlimited number of users. Users are organized in an unlimited number of user groups. Access rights for each [individual object in your PRTG device tree](#)<sup>[83]</sup> can be given separately for each user group (except for sensor channels). Access rights to objects can also be [inherited](#)<sup>[87]</sup>.

In addition, every single user has specific rights: There are administrator users, read/write users, and read only users. You can define these settings in [System Administration—User Accounts](#)<sup>[189]</sup>. With these tools, you can create a rights management that allows you to specify exactly what users will be able to see and edit.

**ACCOUNT CONTROL**

Account Type	<input type="radio"/> Read/Write User <input checked="" type="radio"/> Read Only User
Allow Acknowledge Alarms	<input type="radio"/> Allow <input checked="" type="radio"/> Deny
Primary Group	User Group Read Only
Status	<input checked="" type="radio"/> Active <input type="radio"/> Inactive
Last Login	02.12.2013 18:53:54

User Rights in User Account Settings

Individual user rights in combination with access rights of the group(s) they belong to conduct the access rights to certain objects in the device tree. This means that group membership particularly controls what a user is allowed to do and which objects the user will see when logged in.

The actual access rights for each object in the device tree can be defined in an object's settings. You can define different access rights for all sensors, devices, groups, or probes via the corresponding [Context Menus](#)<sup>[163]</sup> or in the [Object Settings](#)<sup>[142]</sup>.

### Access Rights Overview

The following classes of access rights for objects are available in hierarchical order as they can be given to user groups (lowest rights to highest rights):

- **None:** The object will not be displayed to the users of the group; no logs, no tickets, no alarms regarding this object will appear.
- **Read:** Only monitoring results can be seen.
- **Write:** Reviewing monitoring results and editing settings is allowed. In addition, objects can be added to and deleted from the device tree.
- **Full:** Reviewing monitoring results, editing settings, and editing access rights is allowed. In addition, objects can be added to and deleted from the device tree.
- **Admin rights:** If a user group has administrator rights, all options are available, including creating users, creating user groups, and deleting objects from the device tree. Access restrictions to objects cannot be set for this type of user group.

**Note:** Access rights that are defined locally on an object, for example, on a device, override inherited rights. On a certain object, the highest directly set access right applies for a user group. If there is no access right set directly on an object, the next higher object level will be checked for access rights. This process is repeated until defined access rights are found to be inherited or there is no higher object level.

**Edit Rights for Cisco ASA Primary**

**Edit Access Rights**

Use this page to review and edit access right for an object.

## Part 4: Understanding Basic Concepts | 10 User Access Rights

▪ <b>PRTG User Read/Write</b>	Read-only rights	Read/write rights	Full access	Admin rights
▪ <b>Domain User Read/Write</b>				

- **Users in an administrator group** have always administrator access rights, no matter of the access rights of an object.
- **Read-only users** have just read rights, no matter of the access rights of their group, except for users which are members of an administrator group.
- **Read/write users** in a group with full access to an object have full access rights to this object only.
- If a user is in more than one group, access rights of the user group with the **highest rights** apply.
- Administrator rights can only be given via the administrator group.

For more information about defining access rights, please see the following sections:

- [System Administration—User Accounts](#)  1856
- [System Administration—User Groups](#)  1861

For information about connecting PRTG to an existing Active Directory, please see [Active Directory Integration](#)  2020.

## 4.11 IPv6

PRTG supports the IPv6 protocol for most sensor types. You can define whether data from your network is queried via IPv4 or IPv6: For each device in PRTG you can select whether PRTG will connect to it using either IPv4 or IPv6. This is a simple selection in the [Device Settings](#)<sup>[272]</sup> of each device. Depending on the setting, the sensors created on this device will use the respective protocol.

In the **Outgoing IP Settings** of the [PRTG Probe Administrator](#)<sup>[2016]</sup> you can additionally choose which IPv6 address will be used for outgoing monitoring requests. **Note:** There is the same option for IPv4, too.

# Part 5

## Ajax Web Interface—Basic Procedures

## 5 Ajax Web Interface—Basic Procedures

The Ajax-based web interface is your access to PRTG. It is used to configure devices and sensors, and to set up notifications, as well as to review monitoring results and to create reports. This web interface is highly interactive, uses Asynchronous Java Script and XML (AJAX) to deliver a powerful and easy-to-use user experience. While the user is [logged in](#)<sup>102</sup>, the data on the screen is permanently refreshed (via Ajax calls) so it always shows the current monitoring results (refresh interval and method can be [set](#)<sup>1856</sup> by the user).

Because the web interface works as a **Single Page Application (SPA)**, you will rarely see a full page refresh to avoid this performance impact due to redundant processing. Only single page elements will be refreshed when necessary. All object setting dialogs are shown as pop-up layers, so you will never lose the current context. This speeds up the user experience appreciably and makes the configuration of objects in PRTG comprehensible.

The following sections introduce the features and concepts of the Ajax Graphical User Interface (GUI).

## 5.1 Login

Once the PRTG core server is [installed](#)<sup>[51]</sup>, you can log in to the web interface. In your browser, load the IP address or DNS name of the computer PRTG is installed on and log in using the **Default Login** button.

You can look up and change PRTG's web server settings at any time using the [PRTG Server Administrator](#)<sup>[199]</sup> Windows application on the system where the PRTG core server is installed on. Especially when accessing PRTG from the internet you should use an SSL encrypted connection. You can easily switch to SSL using the **Yes, switch to SSL** button shown on the welcome screen.

### Loading the Web Interface

In a web browser window, please enter the IP address or URL of the system PRTG is installed on. When using a cluster, please connect to the primary master node. You can also double click on the **PRTG Network Monitor** icon on the desktop of the system PRTG is installed on.

**Note:** If you run PRTG on localhost, please do not use the DNS name <http://localhost> to log in to the web server, as this may considerably slow down PRTG's web interface. Please use your local IP address or <http://127.0.0.1> instead.

If you see a certificate warning in your browser, you can usually just confirm it. For more information please see [SSL Certificate Warning](#)<sup>[105]</sup>.

### Login Screen

After loading the web interface, the login screen is shown. You can either login as default administrator or as an other PRTG user. As **Administrator** user you can use all functionalities of the web interface. Administrators can [create additional users](#)<sup>[185]</sup> with administrator rights or with more restricted privileges (for example, read only users).

Additionally, there are different GUI versions available.

PRTG Login Screen

## Login as Default Administrator (First Time Login)

When logging in for the first time, login name and password for the default administrator login are both **prtgadmin**. You can leave the **login name** and **password** fields empty and click on the **Default Login** button to log in using these default credentials.

**Note:** After login you should change the default password. To do so, go to **Setup | Account Settings | My Account** and specify a new password in section **User Account**.

**Note:** If you are not logged in into the web interface, you can change the credentials for this default user account any time in the [PRTG Server Administrator](#) <sup>1010</sup> Windows application.

## Login as PRTG User

If you have received user credentials from your administrator, please enter them here to login. Also, when using other administrator credentials, please enter them here.

## Choose GUI version

Depending on the used browser, different Graphical User Interface (GUI) options are shown:

- **Use AJAX Web GUI (All features, optimized for desktop access):** The standard interface. We recommend to use this option for PRTG whenever possible. It offers the full functionality of PRTG. Use Google Chrome 34 or later (recommended) or Mozilla Firefox 28 or later for best performance. In some browsers, the Ajax option is not shown, for example, in old browser versions.
- **Note:** Although you can login using Microsoft Internet Explorer 10 or 11, the Ajax web interface might **not** be fully compatible with Internet Explorer! When using Microsoft Internet Explorer 10 or 11, please set the security level at least to **Default level Medium-high** and make sure you do not use the **Compatibility View**! For detailed information, please see [More](#) <sup>104</sup> section below.

- **Use Mobile Web GUI (Limited functionality, optimized for mobile access):** The [Mobile Web GUI](#)<sup>[1947]</sup> interface is optimized for slow network connections and old browsers. It only offers read-only functionality and comes with less scripting. It is also a fallback solution when using a browser that is not supported by the Ajax interface.
- **Download Client Software (for Windows, iOS, Android):** This option calls PRTG's download page in the **Mobile Web GUI**. You can optionally download the native Windows application **Enterprise Console** to the desktop (called **Windows GUI** in previous deprecated PRTG versions). It has to be [installed](#)<sup>[1894]</sup> on the client computer before use. The [Enterprise Console](#)<sup>[1894]</sup> provides full functionality; however, for some functions the Ajax Web GUI is opened. As an additional feature, the Enterprise Console can view data of several independent PRTG core installations in a single application. You can also access pages on Paessler's website from here for information about the [PRTG apps](#)<sup>[1950]</sup> **PRTG for Android** and **iPRTG for iOS**. These pages contain also the download links for the apps for your mobile device. **Note:** Also when using this download option, login name and password (or a **Default Login**) are required!

**Note:** Only Google Chrome 34 or later (recommended) and Mozilla Firefox 28 or later are fully compatible with the Ajax web interface. For more information about Internet Explorer support, please see [More](#)<sup>[104]</sup> section below.

Click on the **Login** button to proceed to the PRTG web interface.

## More

Knowledge Base: Why are Internet Explorer IE6 and IE7 not supported by PRTG's Ajax Interface?

- <http://kb.paessler.com/en/topic/7633>

Knowledge Base: How can I access the AJAX web interface of PRTG with Internet Explorer 9 or IE10?

- <http://kb.paessler.com/en/topic/46893>

## 5.2 SSL Certificate Warning

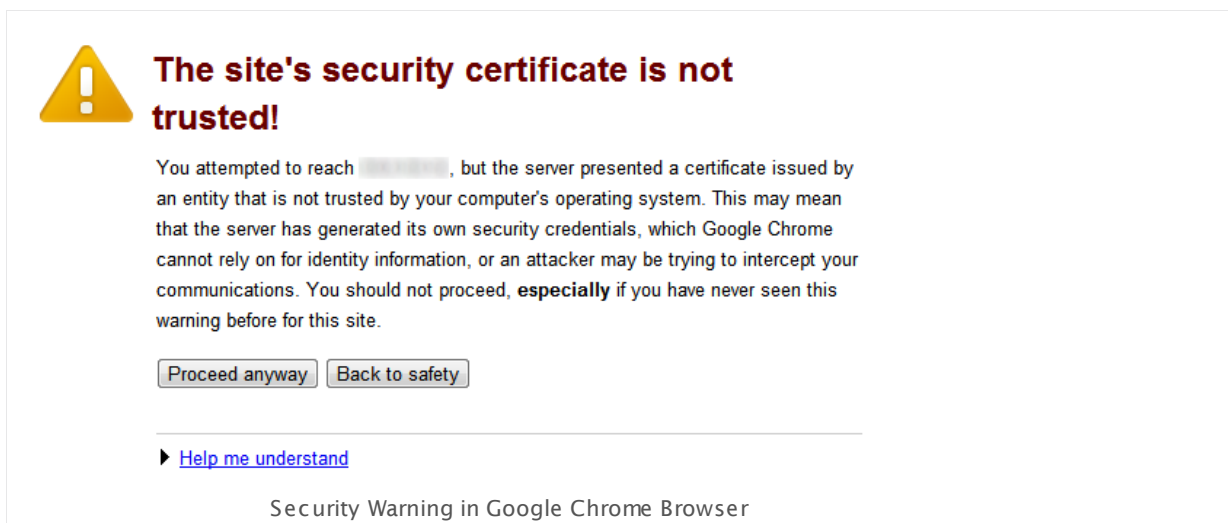

If you use PRTG outside your internal LAN, especially when using it on the internet, you should switch the internal web server to use SSL. After doing so, your browser will show a certificate warning, as the certificate that comes with PRTG cannot be signed by a valid authority. Anyway, the connection to your PRTG web server will be secured via SSL, and you can confirm the claimed security risk. For more information on secure browser connections, please see the [More](#)<sup>[104]</sup> section below.

Every browser shows the certificate warning in a different layout. The steps to take are similar for every browser, yet different in detail:

- [Google Chrome](#)<sup>[105]</sup>
- [Mozilla Firefox](#)<sup>[105]</sup>
- [Internet Explorer](#)<sup>[106]</sup>
- [Other](#)<sup>[107]</sup>

### Google Chrome

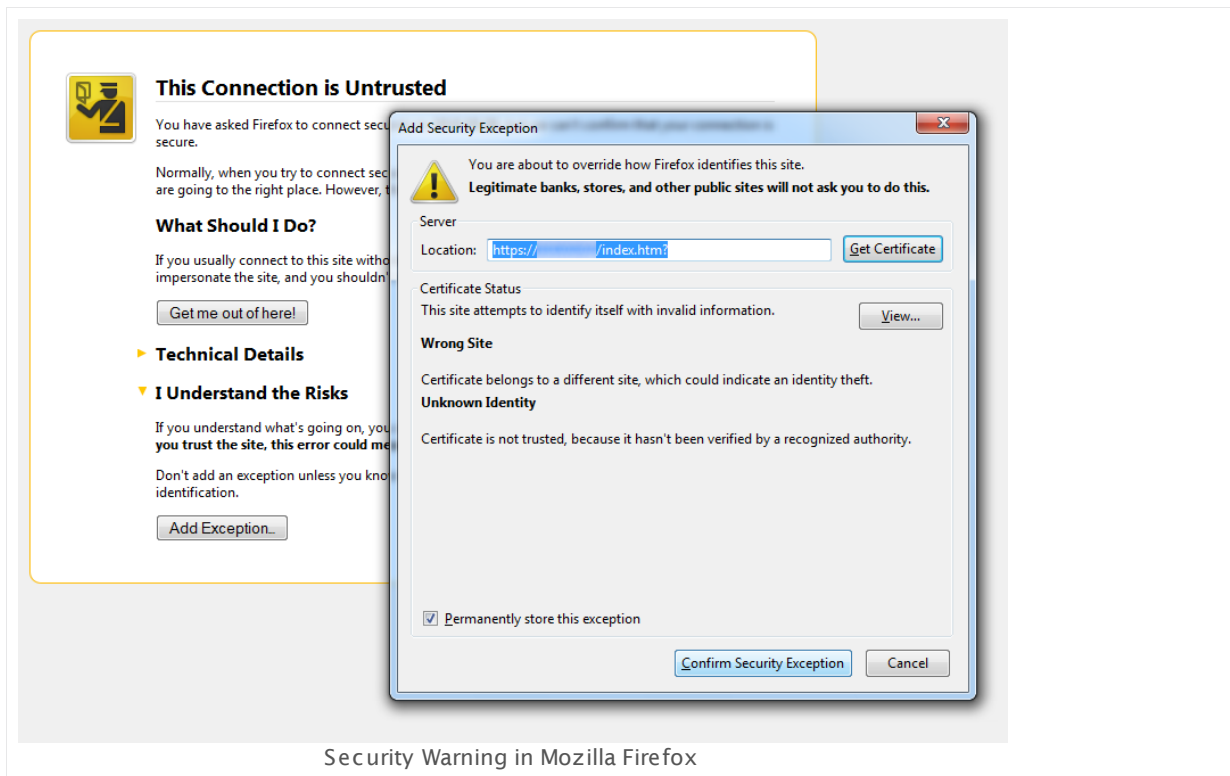

In **Google Chrome**, click on **Proceed anyway** every time you call the web interface.

### Mozilla Firefox

In **Mozilla Firefox**, click on **I Understand the Risks** and then on the **Add Exception...** button. In the appearing window, leave the check mark for **Permanently store this exception** and finally click on the **Confirm Security Exception** button.

## Part 5: Ajax Web Interface—Basic Procedures | 2 SSL Certificate Warning

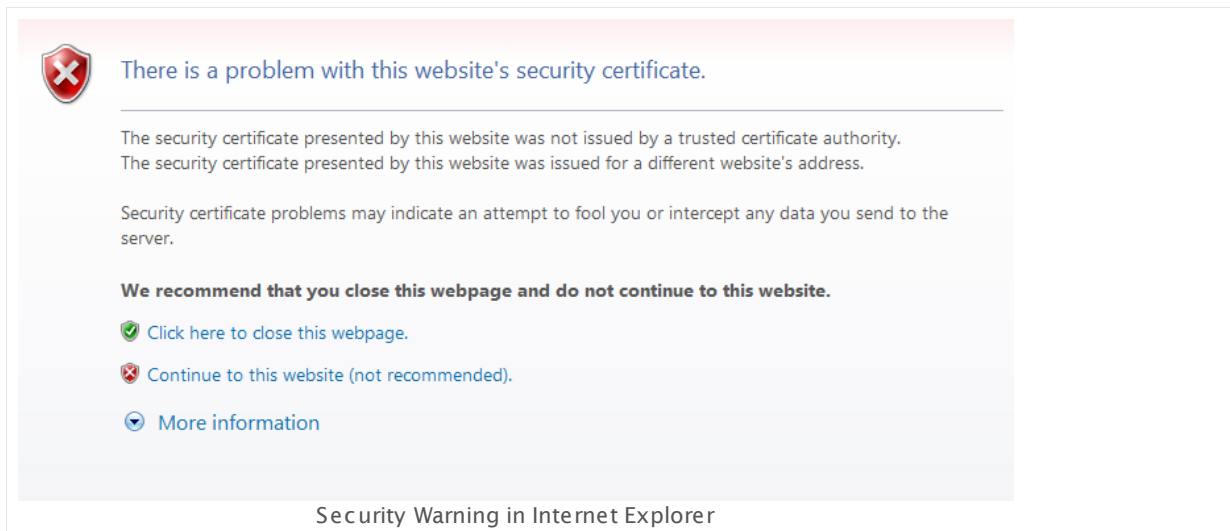

Security Warning in Mozilla Firefox

You only have to go through this procedure once for every Firefox browser and PRTG core server.

## Internet Explorer

In **Internet Explorer**, click on **Continue to this website (not recommended)** every time you call the web interface.

Security Warning in Internet Explorer

## Other

For other browsers, the procedures to confirm the certificate will be similar to the ones described above.

## 5.3 General Layout

This manual section provides an overview about the structure of PRTG's web interface. The main focus is on the **Devices** view which you can select via the main menu bar, because there you see your monitoring results at a glance and, thus, you will widely use it.

### Welcome Page

Once you have run through the [Configuration Guru](#)<sup>36</sup>, you will see PRTG's welcome page as default after you log in to the web interface. You can set another homepage in your [account settings](#)<sup>1812</sup>, section **Web Interface**.

You have the following options on the welcome page:

- [Run Configuration Guru](#)<sup>36</sup>
- [Download Windows Client App](#)<sup>1885</sup>
- [Perform Network Auto-Discovery](#)<sup>190</sup>
- [Install Smart phone Client Apps](#)<sup>1950</sup>
- [Review Results](#)<sup>133</sup>
- **Get Help and Support**: Opens the help center where you find links to this manual, to the Knowledge Base, and the [contact Paessler support form](#)<sup>1889</sup>.

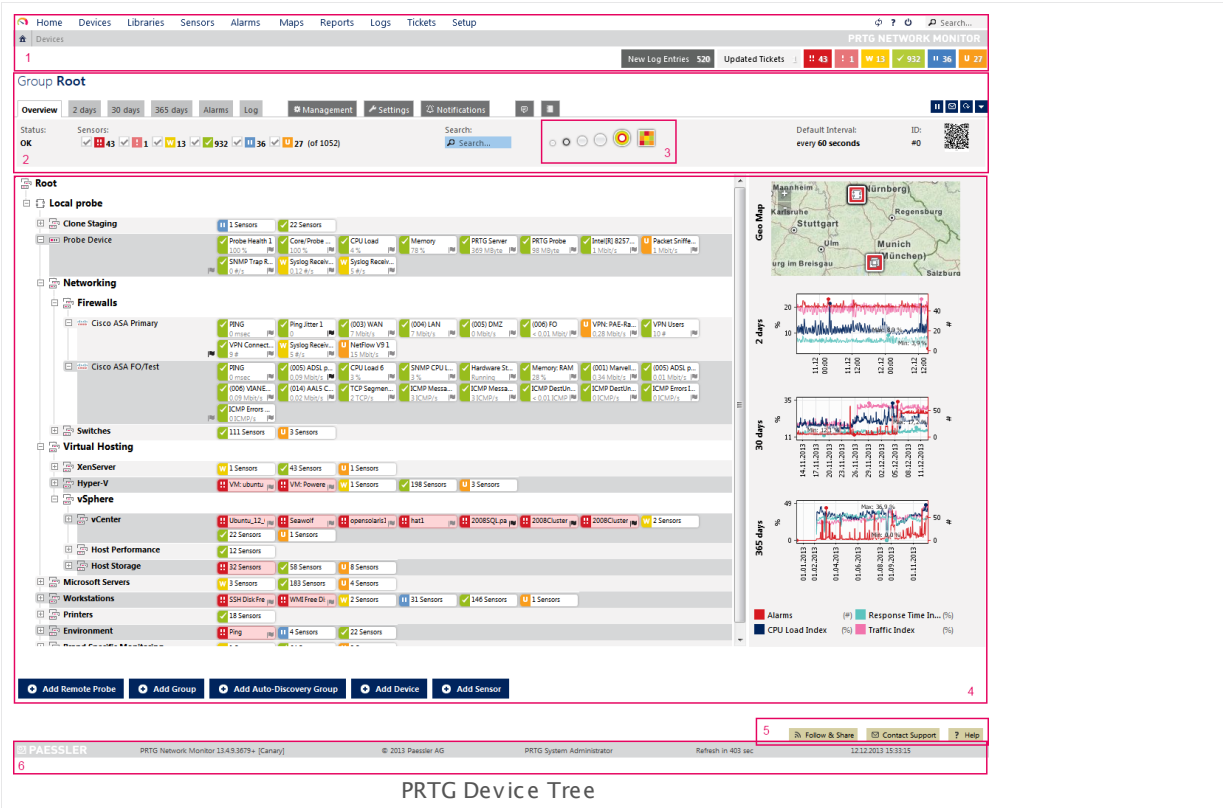

The screenshot displays the PRTG Network Monitor web interface. At the top, a navigation menu includes links for Home, Devices, Libraries, Sensors, Alarms, Maps, Reports, Logs, Tickets, and Setup. A status bar on the right shows system metrics: 11:48, 1.3, 14, 830, 11.36, and 81. The main content area is titled "Getting started with PRTG Network Monitor" and features six large, colorful buttons: "RUN CONFIGURATION GURU" (green), "PERFORM NETWORK AUTO-DISCOVERY" (orange), "REVIEW RESULTS" (teal), "DOWNLOAD WINDOWS CLIENT APP" (blue), "INSTALL SMARTPHONE CLIENT APPS" (pink), and "GET HELP AND SUPPORT" (dark blue). Below these buttons is a security warning: "You should set a secret password if your PRTG website is publicly accessible!" with a "Change default password now" button. The right sidebar contains the PRTG logo and a "NEWS FROM PAESSLER" section with several articles. The footer includes the Paessler logo, version information (PRTG Network Monitor 13.4.3.3658+ [Canary]), copyright (© 2013 Paessler AG), and social media links.

PRTG Welcome Screen

## Tree View Layout

Click on the **Review Results** option on the welcome screen to display the tree-like device view which will be a starting point for everyday use or on **Devices** in the main menu bar.

PRTG Device Tree

From top to bottom, the main layout consists of:

Screen Number	Part	Description
1	<a href="#">Global Header Area</a> 	This element contains the main menu at the top, the global status bar, the path to the currently selected object, and a quick search box.
2	<a href="#">Page Header Bar</a> 	This element contains the page heading with the name of the current object, several tabs with settings, monitoring data, etc. of the current object, the object's status bar, quick action buttons, and the QR code linking to the current URL.
3	<a href="#">Device Tree View</a> 	This selection is part of the page header bar. Using the provided options you can define how your device tree is displayed.
4	<a href="#">Page Content</a> 	This element contains information about the current object and all other objects underneath in the tree hierarchy.
5	Page Footer Icons	<p>With these icons you have quick access to the PRTG Auto-Update page, to PRTG's social network accounts, and to the <a href="#">contact support form</a> . There is also a link to context sensitive help.</p> <p>When running PRTG in a cluster, you will also see a cluster related element. It shows the name of the node you are logged in and displays whether this is a master or a failover node. Click the bar to show the <a href="#">Cluster Status</a> . In a failover node, you can review all data, but changes in the settings will not be saved. In order to change settings, please log into the master node of your cluster.</p>
6	Page Footer	Shows information about the current version of PRTG, the logged in user, the time remaining to the next automatic page refresh, and the current time.

Simply click on an object to see more details about it. In the page heading of the [page header bar](#)  you always see which object you're looking at.

When you navigate through PRTG's web interface you will always use one of the following navigational paths:

- The main menu provides access to all important aspects of the software.
- The quick search is often the fastest way to navigate to an object.
- Using the page's tabs, you can switch between various sub-pages for an object.
- Many objects offer a context menu that will pop up when you right-click them.
- Many objects offer a quick-info menu that will pop up when hovering an object

- And, finally, you are able to drill down into the object hierarchy of probes, groups, devices, and sensors in the object tree by merely clicking an sub-object of the currently displayed object (for example, a sensor on the device page).

These six navigation paths put PRTG's complete functionality at your fingertips. Quite likely you are already familiar with these techniques from many other websites and web-based user interfaces.

In the following, the different areas of the web interface are described.

## Global Header Area

The header area of the web interface is both base for the most important information of your installation and starting point for all actions. You can view the global status and navigate through the web interface using the main menu.

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

The global header area consists of the following parts:

Screen Number	Part	Description
1	Main Menu Bar	Navigating through the web interface is performed using the main menu. Please take a few minutes to familiarize yourself with all menu items and sub-items. A detailed description can be found in the <a href="#">Main Menu Structure</a> <sup>[175]</sup> section.
2	Icons Refresh, Help Center, Logout	With the icons on the right you can reload the current page, open the help center or log the current user out.
3	White Search Box	To search for any monitoring object, enter the name, part of the name, an IP address, a DNS name or a tag in the search box on the right and hit the enter key. A web page with all items that fit the search term will be returned—even displaying online help articles.
4	'Breadcrumbs'	Below the main menu, there is always a path shown, leading to the homepage. Use it to go back to where you came from. It can also help you to orient yourself in case you get lost. If you click on a 'breadcrumb' item to open a drop-down menu showing all available object on the same level. Enter a view letters to search for a name, or select an object directly. For example, you can use this to directly access all other sensors or a device, the other devices within a group, another group on the same probe, or other probes in your root group.
5	Buttons New Alarms, New Log Entries, New Tickets	These buttons show the number of new alarms and new log entries, as well as the number of new tickets. Click on the respective button to view the <a href="#">Alarms</a> <sup>[144]</sup> , <a href="#">Logs</a> <sup>[147]</sup> , or <a href="#">Tickets</a> <sup>[149]</sup> .
6	Global Sensor Status Symbols	This area shows the aggregated status of all sensors you have configured for monitoring, divided into different sensor states. Depending on the sensors' status you will see colored boxes with numbers which symbolize the sensors. For example, you can see how many sensors are in <b>Up</b> , <b>Down</b> , or <b>Warning</b> state. Click on a box to view a list of all sensors in the respective status. For a detailed description, please see <a href="#">Sensor States</a> <sup>[121]</sup> section.

## Page Header Bar

In the page header under the global header area, you see the name of the current object and the page content underneath. When displaying a group, aggregated sensor states are shown in a sensor bar and there is an option to change the tree view. Furthermore, various information about the current object is reported here.

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

The page header and tabs area consists of the following parts:

Screen Number	Part	Description
1	Page Heading	This line displays the kind of the current object and the name as page heading. In the screenshot above, it is a group which is called <b>Root</b> . Here you also can add the current object to favorites by clicking on the flag, as well as you can define the object's priority by clicking on one of the five stars (not available for the Root group). For details, please see section <a href="#">Priority and Favorites</a> <sup>[160]</sup> .
2	Tabs	Using the tabs you can navigate to various sub-pages of an object, showing monitoring data or changing settings. For more information, please see sections <a href="#">Review Sensor Data</a> <sup>[124]</sup> and <a href="#">Change Device and Sensor Settings</a> <sup>[142]</sup> .
3	Context Buttons	On the right side are icons which allow you to perform several actions. Depending on the currently viewed page within PRTG, you can pause (and resume) or delete this object, add another object (for example, a sensor to a device), send a link to the current page per email, perform an immediate scan, open a related ticket, and show the corresponding <a href="#">object history page</a> <sup>[147]</sup> . By clicking on the down arrow, you can open the context menu for the currently displayed object with even more options. For more information, please see <a href="#">Context Menus</a> <sup>[163]</sup> section.
4	Object Status	This element indicates the current status of the selected object.
5	Sensor Status Bar	This element is visible when viewing a probe, a group (including <b>Root</b> ), or a device. It is not available when viewing a sensor's details. The sensor status bar shows the aggregated status of all sensors for the current object, divided into different sensor states. They show the number of sensors in the respective state. For example, you can see how many sensors are in <b>Up</b> , <b>Down</b> , or <b>Warning</b> state. For a detailed description of sensor states, please see <a href="#">Sensor States</a> <sup>[121]</sup> section. You can hide sensors that are in a certain state by removing the check mark symbol in front of the respective sensor symbol. To show them again, re-add the check mark.
6	Tree Search	In the white search box next to the tree view selection, enter a key word to search the device tree for matching names. The tree will then highlight matching devices and sensors by graying out all others. This can help to gain a quick overview over sensors monitoring a specific part of your network. For example, you can enter the keyword "firewall" to highlight devices and sensors which match this name.
7	Device Tree View	This element is only visible when viewing a probe or a group. It is not available when viewing a device's or sensor's details. For a detailed description, see <a href="#">Switch Device Tree View</a> <sup>[115]</sup> below.
8	Scanning Interval	This element shows in what time interval PRTG scans the current object.

## Switch Device Tree View

When viewing a probe or group, you can choose the way your device tree is shown.

### Switch Device Tree View—Classic Device Tree

Using the different circle symbols in the page header bar, you can define how much space is used to show devices and sensors in a hierarchical tree structure. In four steps, you can switch from a very condensed view (small circle; marked with **1** in the screenshot) up to an extra large view (big circle; marked with **4** in the screenshot).

In the classic device tree view you can **collapse** devices, groups, and probes. Click on the minus box left to the object's name. The sensor states will be summarized then. Each status of the sensors on this object will be displayed with the number of sensors currently being in this status—with the exception of the states **Down**, **Down (Partial)**, and **Down (Acknowledged)**. These will be summarized respectively not before there are more than ten sensors in this status, otherwise they are displayed individually.

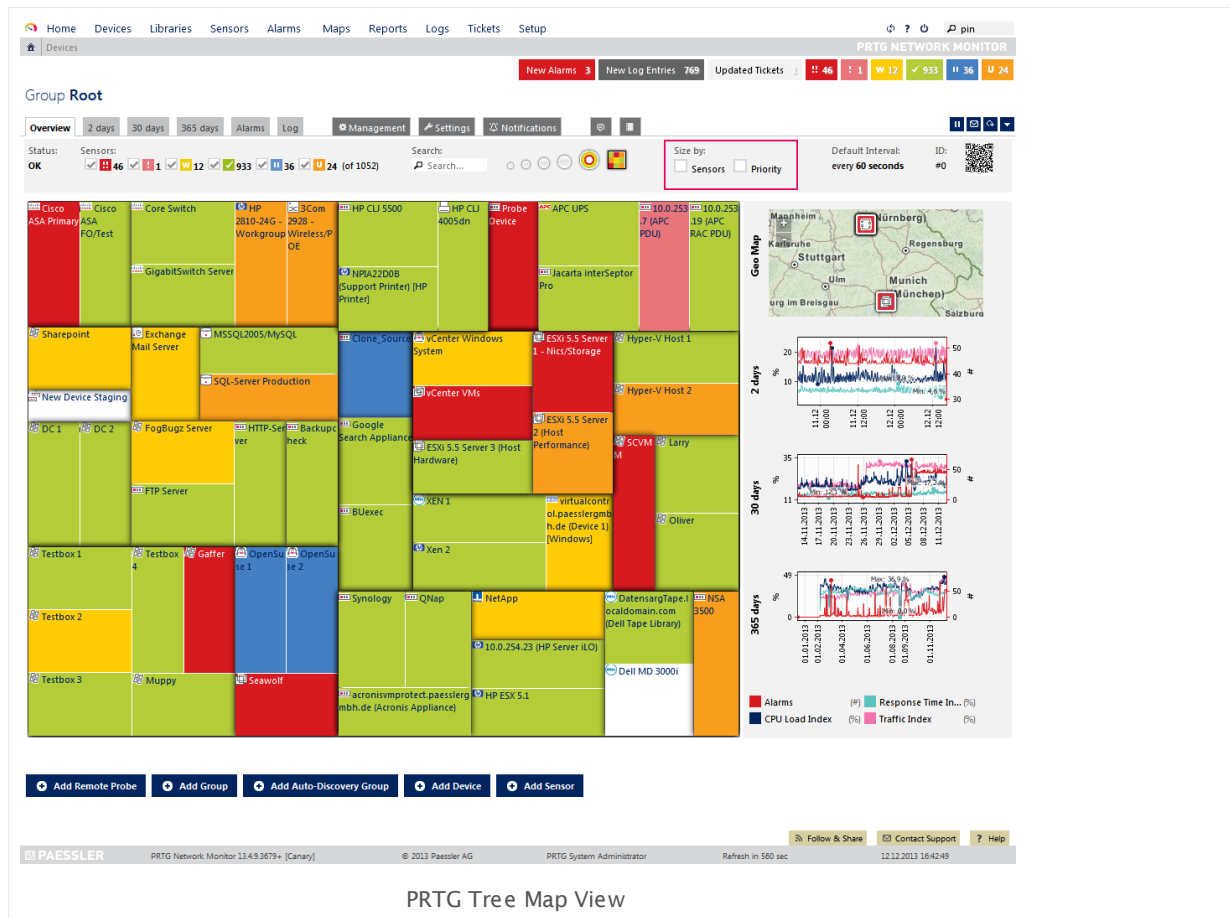

### Switch Device Tree View—Extended Views

There are two additional options to the simple tree views which enable you to display the status of all sensors of your entire installation in a single overview. Click on one of the icons to change the view:

#### Tree Map View (6)

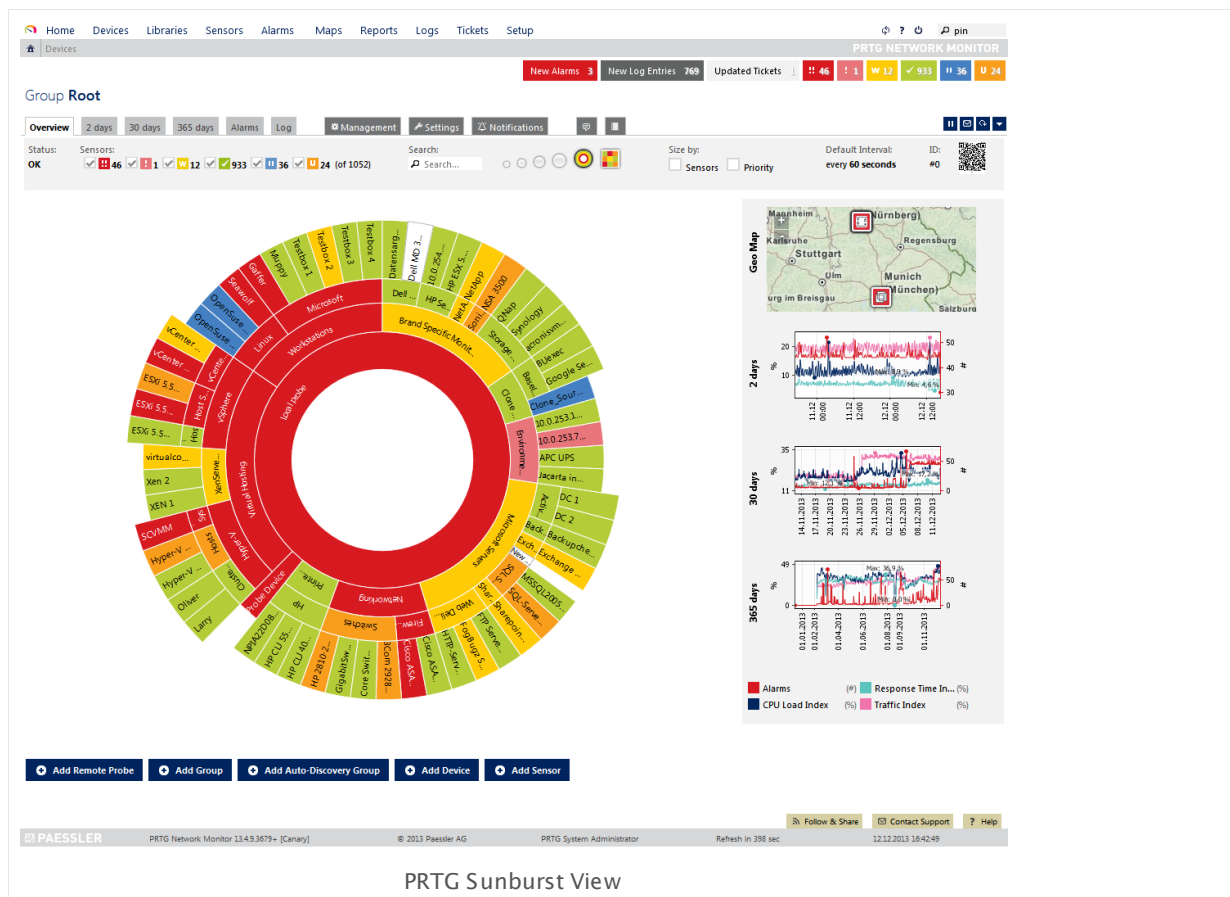

The tree map view tiles all devices of your entire installation into one square, arranged by the groups you put them into. Each device changes color dynamically to reflect the overall status of the sensors on the device. You can also adjust the size of the squares: either depending on a device's priority, or depending on the number of sensors on a device, or depending on both. For this concern, add a check mark under the point **Size by:** in front of **Sensors** and/or **Priority** in the page header bar (see the mark in the screenshot below).

## Part 5: Ajax Web Interface—Basic Procedures | 3 General Layout

**Sunburst View (5)**

The sunburst view shows your entire installation in one circle diagram. The groups are represented as inner circles, and all devices contained within a group are shown as 'cake slices' attached to the outside of a circle element.

PRTG Sunburst View

For both views:

### ■ Colors

A device (or group) element can have different colors, depending on the states of the sensors running on this device or group (see [Sensor States](#)). A more severe status is regarded more important and wins the color battle. For example, if a device currently has sensors in the states **Up** (green), **Paused** (blue), and **Warning** (yellow), the according device tile in this view would be yellow, indicating that at least one sensor on this device is in **Warning** status. If there are any red **Down** sensors, the according device tile will turn red. Following, all possible states in both views are listed ordered by their hierarchy:

Flag	Flag Color	Object Status	Meaning
	Red	<b>Down</b>	At least one sensor of this object shows a red <b>Down</b> status. Hover an object's name to view the total number of alarms concerning this object.
	Bright-Red	<b>Down (Acknowledged)</b>	At least one sensor of this object is <b>Down</b> and the status was acknowledged by a PRTG user, applying the <b>Acknowledge Alarm</b> function. The <b>Down</b> states of all sensors of this object have to be acknowledged—if at least one sensor is unacknowledged down, this object will be displayed as <b>Down</b> .
	Yellow	<b>Warning</b>	At least one sensor of this object shows a yellow <b>Warning</b> status. There is no sensor in a <b>Down</b> or <b>Down (Acknowledged)</b> status concerning this object.
	Orange	<b>Unusual</b>	At least one sensor of this object shows an orange <b>Unusual</b> status. There is no sensor in a <b>Down</b> , <b>Down (Acknowledged)</b> , or <b>Warning</b> status concerning this object.
	Green	<b>Up</b>	All sensors of this object are in a green <b>Up</b> status. There is no sensor in a <b>Down</b> , <b>Down (Acknowledged)</b> , <b>Warning</b> , <b>Paused</b> , or <b>Unusual</b> status concerning this object.
	Blue	<b>Paused</b>	All sensors of this object show a blue <b>Paused</b> status. There is no sensor in a <b>Down</b> , <b>Down (Acknowledged)</b> , <b>Warning</b> , <b>Unusual</b> , or <b>Up</b> status concerning this object.
	Black (Grey)	<b>Unknown</b>	All sensors of this object have an <b>Unknown</b> status. There is no sensor in a <b>Down</b> , <b>Down (Acknowledged)</b> , <b>Warning</b> , <b>Unusual</b> , <b>Paused</b> , or <b>Up</b> status concerning this object.

#### ▪ Size by Sensors / Size by Priority

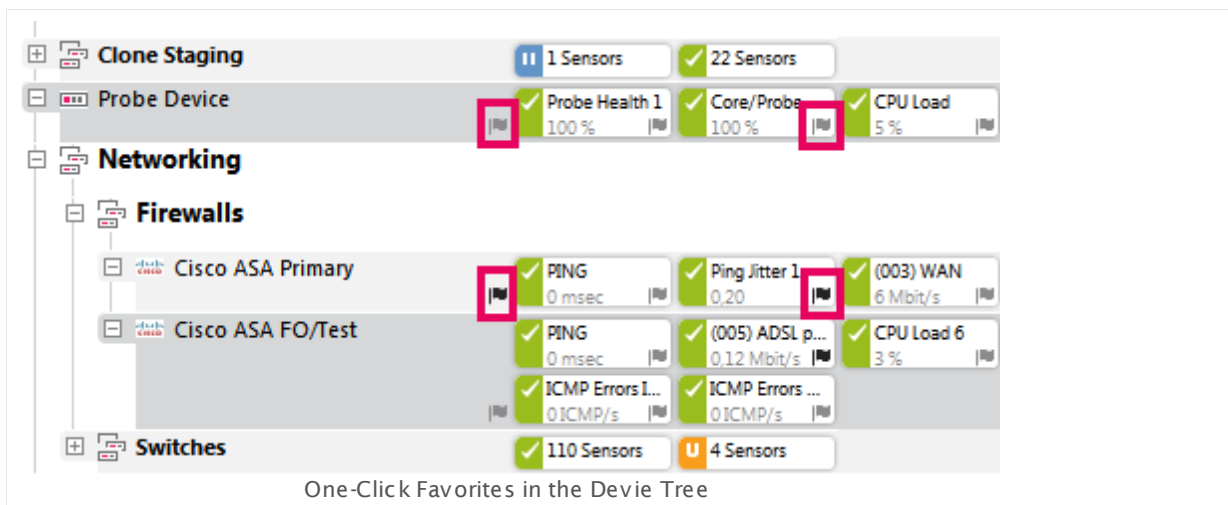

You can adjust the size of the different squares. They can be calculated by the number of sensors running on a device or within a group, or by the sensors' priority (see [Priority and Favorites](#) )<sup>160</sup>), or both. Use the check boxes in the page header bar (see the mark in the [tree map view screenshot](#)) to change view immediately, then use the setting that suits best for your needs.

## Page Content

The page content of the general layout varies dependent on the selected object. It shows information about the current object and all other objects underneath in the tree hierarchy. The deeper down in the hierarchy you select an object, the more detailed is the displayed information.

By default, a **Probe Device** is created in the device tree on the local probe. It represents the probe system running with your PRTG installation. PRTG automatically monitors the system health of the core server and each probe in order to discover overloading situations that may distort monitoring results. To monitor the system status of the probe computer, PRTG automatically creates a few sensors. These include a **Core/Probe Health Sensor**, a WMI sensor that measures disk usage, and a bandwidth sensor for all installed network cards. It is recommended to keep these sensors, but you can optionally remove all except the **Core/Probe Health** sensor. In a cluster installation, PRTG also creates a **Cluster Probe Device** with a [Cluster Probe Health Sensor](#)<sup>355</sup> that monitors the cluster's system health.

You can add (or remove) a device or sensor to favorites by one click on the respective flag displayed with an object (please see the marks in the screenshot below).

Another one-click option for adding/removing favorites or setting the priority for a selected device or sensor is given in the [page header bar](#)<sup>113</sup> right to the object name (please see screen number 1 in that subsection). Simply click on the flag for favorites or on a star for priority.

Device **Cisco ASA Primary** | ★★★★★  
One-Click Favorite and Priority in the Page Header Bar

A black flag means that the respective object is a favorite already; clicking on the black flag will remove the object from favorites. A gray flag indicates that it is not a favorite yet. Please see also [Priority and Favorites](#)<sup>160</sup> for this concern.

For more details about page contents, please see the following sections:

- [Review Monitoring Data](#)  124
- [Historic Data Reports](#)  133
- [Object Settings](#)  142
- [Compare Sensors](#)  130
- [Geo Maps](#)  1744

## More

Knowledge Base: How can I change the width of the devices and group "boxes" shown in the PRTG 9 device tree?

- <http://kb.paessler.com/en/topic/24963>

## 5.4 Sensor States

In PRTG's device tree you usually create several sensors on each [device](#)<sup>[272]</sup>. With sensors, you can monitor different aspects of your devices. Using a simple color code, they always show you what is going on in your network.

The color of a sensor always shows its current status. Following, you find a list of states a sensor can show. This list also reflects the hierarchy of states whenever summarized sensor states are shown (in the [device tree](#)<sup>[109]</sup>, or on [geo maps](#)<sup>[1744]</sup>): the higher a status is in the hierarchy, the higher will be its priority in displaying sensor states. For example, if all the sensors of a specific device are **Up**, but one of its sensors reached a **Down** status, then the overall status of this device will be **Down** as well (for example, displayed red in the [Tree Map View](#)<sup>[115]</sup>), as this state is hierarchically higher. **Note:** **Down** and **Down (Partial)** states are hierarchically equal.

Sensor	Color	Status Name	Meaning
	Red	<b>Down</b>	<ol style="list-style-type: none"> <li>1. PRTG is not able to reach the device or the sensor has reached an error state. Please see <a href="#">Sensor Warning and Down Behavior</a><sup>[122]</sup> below for more information. <b>Note:</b> By design, a sensor does not record any data in its channels while it shows this status.</li> <li>2. Another reason for this status can be an error limit that is set in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup>, or an error status due to a sensor <a href="#">Lookup</a><sup>[2039]</sup>. <b>Note:</b> In this case, the sensor continues to record data in all sensor channels although the sensor shows an error.</li> </ol>
	Red/Green	<b>Down (Partial)</b>	In a cluster, at least one node reports this sensor as <b>Down</b> , while at least one other node reports the same sensor as <b>Up</b> .
	Bright-Red	<b>Down (Acknowledged)</b>	The sensor is <b>Down</b> and the status was acknowledged by a PRTG user, applying the <b>Acknowledge Alarm</b> function. This can be helpful to mark that an alarm has already been attended to. For acknowledged alarms no more <a href="#">notifications</a> <sup>[1745]</sup> are sent. To set this sensor status, right-click on a sensor in a <b>Down</b> status and from the <a href="#">context menu</a> <sup>[163]</sup> , select <b>Acknowledge Alarm....</b> Then enter a comment and click <b>OK</b> .

Sensor	Color	Status Name	Meaning
	Yellow	<b>Warning</b>	There was an error reading the sensor, but PRTG will try again. The sensor may soon change to a down status. Please see <a href="#">Sensor Warning and Down Behavior</a> <sup>[122]</sup> below for more information. Another reason for this state can be a warning limit set in a sensor's <a href="#">Sensor Channels Settings</a> <sup>[1709]</sup> .
	Orange	<b>Unusual</b>	The sensor reports unusual values for this weekday and time of day. The unusual detection is based on the historic average data and can be configured or disabled in the <a href="#">system administration</a> <sup>[1839]</sup> . You can also disable unusual detection for certain groups only (see <a href="#">Group Settings</a> <sup>[270]</sup> ).
	Green	<b>Up</b>	The last check was okay and the sensor receives data.
	Blue	<b>Paused</b>	The sensor is currently paused (for a certain time or unlimitedly, or by dependency).
	Black (Gray)	<b>Unknown</b>	The sensor has not been checked yet by PRTG or there is an error in (network) communication, likely on the probe system. If sensors show this status persistently, a PRTG restart may be necessary. For extended trouble shooting please see <a href="#">More</a> <sup>[123]</sup> section below.

## Sensor Warning and Down Behavior

The **Down** status symbolizes that something is wrong with a monitored device. There can be various reasons for a down status, for example, an interruption in the physical connection to the device, an internet connection outage, or a crashed server.

After a failed request, PRTG tries to reach the device again before setting a sensor to **Down** status (this is true for almost all types of sensors):

1. If a request to a device fails for the first time, the sensor is set to **Warning** status. PRTG repeats the request and tries to re-scan the device immediately.
2. If also the second request fails, the sensor is set to **Down** status until the device is reachable again. PRTG tries to reach the device with every scanning interval.

This procedure gives devices and services the chance to recover from a momentary overload and prevents false alarms. Still, you are informed promptly about any failures occurring.

**Note:** The behavior described above does **not** apply to a **Warning** or **Down** status that is activated due to a warning or error limit set in the [Sensor Channels Settings](#)  1709.

## 5.5 Review Monitoring Data

Pages of probes, groups, device, and sensors have a tab-like interface. Using the tabs you can navigate through various sub-pages of an object in order to show your network's status, view monitoring results, or change settings.

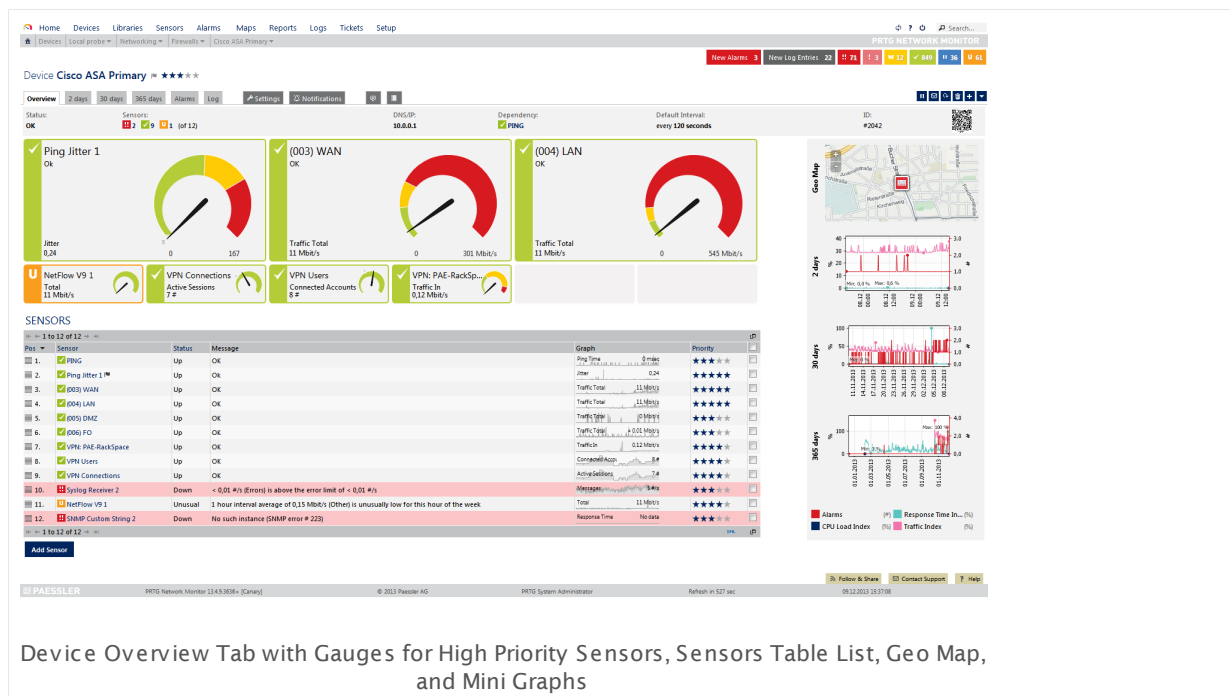

### Overview

The **Overview** tab shows an overview of the currently selected object and of its sensors. The pages share a common layout, but include different elements, depending on the kind of object you look at:

- For **probes** and **groups**, the **Overview** tab shows a tree-like view with devices and sensors, a GeoMap, as well as summary graphs for different time spans of the current probe or group.
- For **devices**, the **Overview** tab shows device details, a GeoMap, and summary graphs for different time spans, colored gauges for high priority sensors, as well as a table list of all sensors on this device.  
**Note:** In order to display gauges which represent sensor states, corresponding sensors need to be tagged with 4 stars (\*\*\*\*) or 5 stars (\*\*\*\*\*). In the [priority settings](#)<sup>[160]</sup>, 5 stars sensors will be represented with bigger gauges than 4 stars sensors.
- For **sensors**, the **Overview** tab shows sensor details, current status, a GeoMap, colored gauges which represent the last value of particular sensor channels (the primary channel in biggest size; not available for the **Downtime** channel), sensor graphs for different time spans, a table with all sensor channels, as well as [similar sensors](#)<sup>[138]</sup> which show correlations in your network.

**Note:** For sensors using [lookups](#)<sup>[2039]</sup>, we recommend staying below 120 lookup values in the primary channel to get expressive gauges. For sensors with a priority of 4 stars, the upper limit is around 40 lookup values.

## Toplists

**Toplists** are available for [xFlow and Packet Sniffer sensors](#)<sup>[29]</sup> only. Toplist graphs are displayed right on the sensor overview page. Please see section [Toplists](#)<sup>[1728]</sup>.

## Live Data and Data By x Days

Select one of the tabs **Live Data** (available for sensors only), **2 days**, **30 days**, or **365 days** to display an object's monitoring data live (sensors only), or for different time spans and in more or less detail. **Note:** The days mentioned here are the default setting. You can change the detail of the different graphs any time in the [system administration](#)<sup>[1835]</sup>.

## Part 5: Ajax Web Interface—Basic Procedures | 5 Review Monitoring Data

## Live Data and Data By x Days—Probes, Groups, and Devices

For probes, groups, and devices, each of the tabs shows a summary graph for the current object and mini graphs for all sensors on this object, as well as a data table for the current object. There are never more than 50 mini graphs displayed for performance reasons. **Hover** a mini graph to see the graph legend.

The summary graph shows the number of alarms as well as three **index graphs**. These graphs indicate response time, CPU usage, and bandwidth usage for all sensors. Index graphs are similar to a stock index. The shown values are based on the readings of all sensors of this object. PRTG computes these values using statistics and by comparing the values to the highest and lowest readings ever recorded.

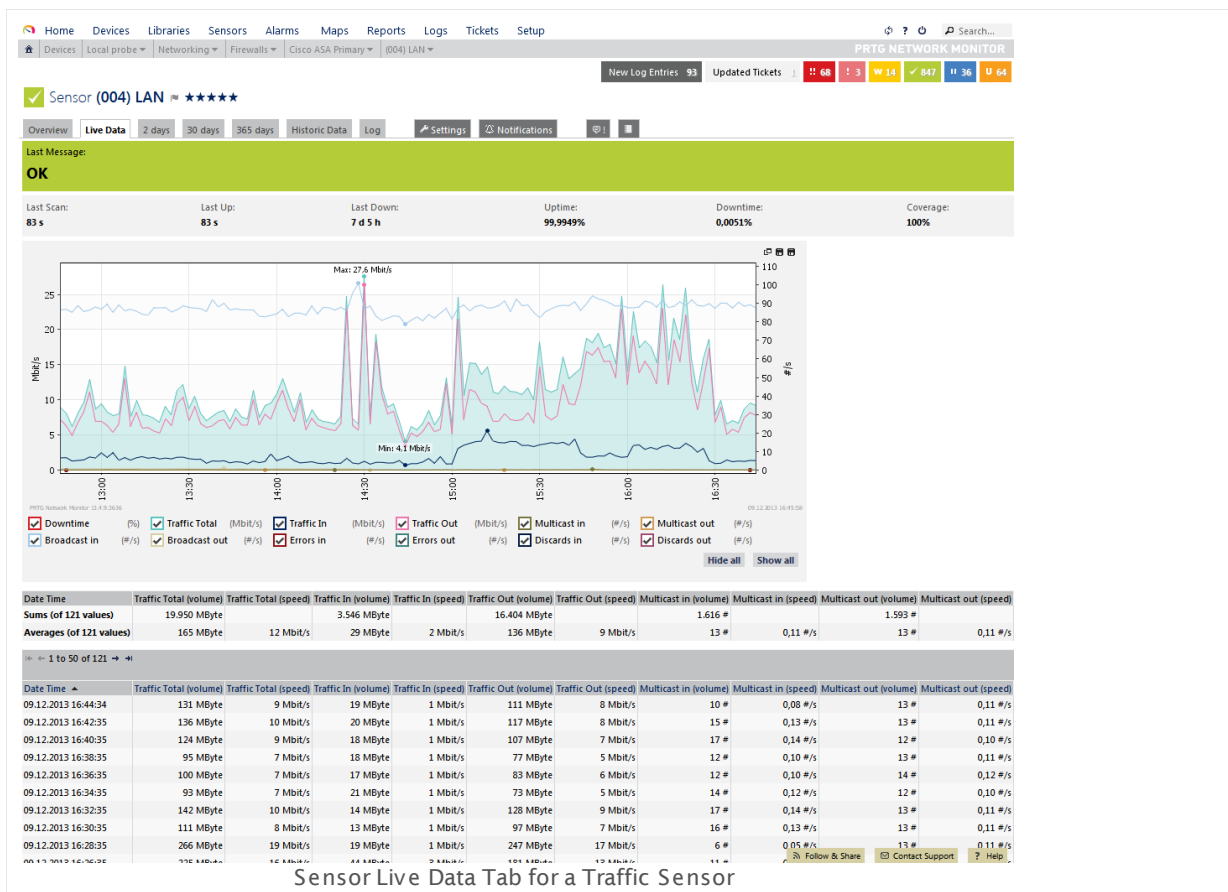

The three index graphs shows overall (or global) trends in your network. If these values increase during a specific time frame, then CPU load, bandwidth load, or response time respectively have worsened during this time. For example, a **CPU Load Index** value of 90% means that the average CPU load for all CPU sensors of your current configuration is at 90% of the highest ever measured CPU usage value.

The following four channels are available in the summary graph:

- **Alarms:** Sums up the number of all down states of sensors on this object during the given time span. This graph provides you a bird's eye view of trouble in your network. It cannot be hidden.
- **Response Time Index:** Indicates request times in your network.
- **CPU Load Index:** Indicates the CPU usage in your network.
- **Traffic Index:** Indicates the bandwidth usage in your network.

See section [More](#)<sup>129</sup> for a detailed description of the index graphs.

You can hide single channels individually except the "Alarms" channel. Simply remove the check mark symbol in front of a channel name besides the graph, and the according channel's line will disappear. You can also **Show all** or **Hide all** channels by clicking on the buttons underneath the channel names. The graph view will be reset immediately.

## Live Data and Data By x Days—Sensors

For sensors, the tabs show a graph and data table of the selected sensor. When viewing data of a sensor running on a cluster probe, you can additionally select if you want to show the data of all nodes, or of one specific node only. Please use the **Select Cluster Member** bar below the tabs. **Note:** Multi-node graphs are never displayed filled here, but with single lines only. However, historic data reports can have filled multi-node graphs.

While viewing a sensor graph you can hide single sensor channels individually. Simply remove the check mark symbol in front of a channel name underneath the graph, and the according channel's line will disappear. You can also **Show all** or **Hide all** channels by clicking on the buttons besides the channel names. The graph view will be reset immediately.

In the upper right corner of every graph, you will find three small icons. Using them, you can do the following:

- **Zoom graph in new window:** This will open a larger version of the graph in a new browser window.
- **Download the graph (PNG or SVG):** This will show a PNG or SVG file of the graph in a new browser window. You can then save or copy it for later use.

## Historic Data

The **Historic Data** tab is available for sensors only. Please see section [Historic Data Reports](#) <sup>[133]</sup>.

## Sensors Lists

Viewing lists of sensors is a great way to keep an eye on your network's status, as you can select which kind of sensors you would like to see. There are many different sensor list views available, such as a list of favorite sensors and top 10 lists; lists filtered by current sensor status, value, availability, tag, or type; there is a sensor cross reference, and many more.

Sensor lists are available from the main menu bar. **Click** the **Sensors** entry to show a table list of all sensors. In the [table list](#) <sup>[156]</sup> appearing, you can re-sort the items by clicking on the column's header items. **Hover** to show other menu options. For detailed information about the available options, please see [Main Menu Structure](#) <sup>[178]</sup> (**Sensors**) section.

## Alarms

The **Alarms** tab is not available for sensors, but for probes, groups, and devices only. Please see section [Alarms](#) <sup>[144]</sup>.

## Log

The logs tab shows past activities and events regarding the currently selected object. Please see section [Logs](#) <sup>[147]</sup>.

## 5.6 Compare Sensors

This function allows you to visually compare the graphs of two or more specific objects. The selected graphs will be shown next to each other so you can have a look at all of them at the same time.

To open the page to compare graphs of several monitoring objects, from the main menu, choose **Sensors | Compare Sensors**. Select how many sensors you want to compare.

Once you have chosen the number of sensors that will be compared, an assistant will open where you can define your desired sensors and the time span shown in the graphs.

## Compare Sensors Settings

### Options

#### Time Span

Specify the time span for which you want to show the graphs for. Choose between:

- 2 days
- 30 days
- 365 days

### Data Comparison

Select the objects you want to show a graph for. Click on **Please click here to edit!** to open the [Object Selector](#)<sup>159</sup>. There will appear as many selection screens as you have defined before.

## Part 5: Ajax Web Interface—Basic Procedures | 6 Compare Sensors

The graphs will be shown immediately after object selection.

## Related Topics

If you want to create a sensor that combines the data of different other sensors, please see the following sensor type:

- [Sensor Factory Sensor](#) <sup>856</sup>

## 5.7 Historic Data Reports

For quick reporting on monitoring data, use historic data reports as an alternative to the exhaustive [reports](#)<sup>[177]</sup> function. You can view a report of the historic data for each single sensor, on demand. Additionally, you can also export this data and download it to your computer for further processing in external applications.

There are two possibilities to call the function for historic data reports: Either you click on the **Historic Data** tab on a sensor's detail page, or you choose **Sensors | View Historic Data** from the [main menu](#)<sup>[178]</sup>.

### Historic Data (Sensor Tab)

Pages of probes, groups, device, and sensors have a tab-like interface. Using the tabs you can navigate through various sub-pages of an object in order to show your network's status, view monitoring results, or change settings.

The **Historic Data** tab is available for sensors only (not for probes, groups, or devices). When calling the historic data reports via this tab, there is no sensor selection available, because you have already determined which sensor you would like to create a report for.

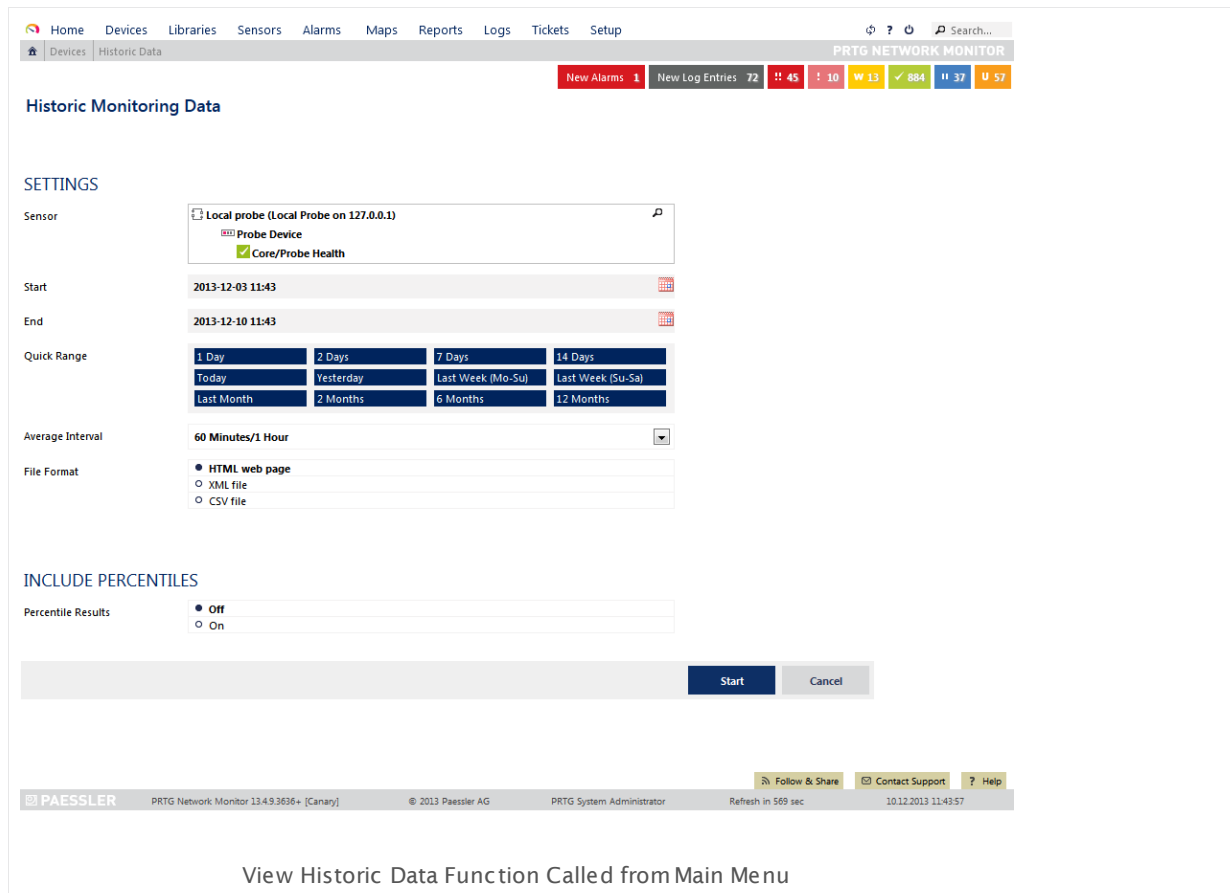

## Part 5: Ajax Web Interface—Basic Procedures | 7 Historic Data Reports

The screenshot displays the PRTG Network Monitor web interface. At the top, there is a navigation bar with links: Home, Devices, Libraries, Sensors, Alarms, Maps, Reports, Logs, Tickets, and Setup. Below this is a breadcrumb trail: Devices > Local probe > Networking > Switches > HP 2810-24G - W... > PING 8. A status bar shows 'New Alarms: 2', 'New Log Entries: 68', and various status icons. The main content area is titled 'Sensor PING 8' with a five-star rating. Below the title are tabs: Overview, Live Data, 2 days, 30 days, 365 days, Historic Data (selected), and Log. There are also links for Settings, Notifications, and a help icon. The 'REVIEW OR DOWNLOAD HISTORIC SENSOR DATA' section contains form fields for 'Start' (2013-12-09 11:42) and 'End' (2013-12-10 11:42). A 'Quick Range' section offers buttons for 1 Day, 2 Days, 7 Days, 14 Days, Today, Yesterday, Last Week (Mo-Su), Last Week (Su-Sa), Last Month, 2 Months, 6 Months, and 12 Months. The 'Average Interval' is set to '60 Minutes/1 Hour'. The 'File Format' section has radio buttons for HTML web page (selected), XML file, and CSV file. The 'INCLUDE PERCENTILES' section has radio buttons for Off (selected) and On. At the bottom of this section are 'Start' and 'Cancel' buttons. The footer contains the PAESSLER logo, version information (PRTG Network Monitor 13.4.9.3636+ [Canary]), copyright (© 2013 Paessler AG), user information (PRTG System Administrator), a refresh timer (Refresh in 591 sec), and a timestamp (10.12.2013 11:42:09). There are also links for Follow & Share, Contact Support, and Help.

Historic Data Tab of a Ping Sensor

## Historic Monitoring Data (Sensors Menu)

When calling the historic data reports via the **View Historic Data** entry from the **Sensors** entry in the main menu, an additional option is available, enabling you to choose the sensor you want to create a report for.

View Historic Data Function Called from Main Menu

## Historic Monitoring Data Settings

Settings	
Sensor	This field is only visible if you called this function via the main menu. Select the sensor you would like to create the report for: Click on the reading-glass symbol to open the object selector. For more information, please see section <a href="#">Object Selector</a> <sup>[159]</sup> .
Start	Specify the start date and time of the data you want to review. Use the date time picker to enter the date and time.
End	Specify the end date and time of the data you want to review. Use the date time picker to enter the date and time.
Quick Range	<p>In this section several links are provided for a faster selection of start and end date. Click on any of these links to change the <b>Start</b> and <b>End</b> values above. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>1 Day, 2 Days, 7 Days, or 14 Days:</b> Set the date range to the respective day(s). The current time of today will be the end date.</li> </ul>

Settings	
	<ul style="list-style-type: none"> <li>▪ <b>Today, Yesterday, Last Week (Mo-Su), Last Week (Su-Sa), Last Month, 2 Months, 6 Months, 12 Months:</b> Set the date range to the last matching period, starting <b>00:00</b>, ending <b>00:00</b> of the particularly following day.</li> </ul>
Average Interval	<p>With this option, you can activate and set up averaging. Select an interval for which the average value should be calculated. You can choose between <b>No Interval</b> (no averaging will be performed and only raw data displayed), a few seconds, minutes, hours, or a whole day (<b>24 Hours</b>). A smaller interval will result in a more detailed report for this sensor. The best settings for you vary, depending on the scanning interval of the sensor, the selected date period and, of course, the intended use for the report. It might be useful to try different settings to see what the results look like. Please also see the section <a href="#">Automatic Averaging</a><sup>137</sup> below.</p>
Cluster Node	<p>This field is only visible if the sensor is running on a cluster probe. Select the cluster node's data that will be used for the report. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>All nodes:</b> Include the data of all cluster nodes in the report.</li> <li>▪ <b>[Several specific nodes]:</b> Use a specific node's data for the report. The nodes shown are specific to your setup.</li> </ul>
File Format	<p>Select the output format for the report. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>HTML web page:</b> Display the result directly as HTML web page. This is also a good option to check results before exporting to another file format.</li> <li>▪ <b>XML file:</b> Export the data as Extensible Markup Language (XML) file. Usually, your browser will show a download dialog.</li> <li>▪ <b>CSV file:</b> Export the data as Comma Separated Values (CSV) file, for example, for import into Microsoft Excel. Usually, your browser will show a download dialog.</li> </ul>

Include Percentiles	
Percentile Results	<p>Select if percentiles will be shown in the report. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Off:</b> No percentiles will be calculated.</li> <li>▪ <b>On:</b> Percentiles will be enabled in the report. In the overview table, additional values will be displayed with averages/sums for each sensor channel. Please define additional settings below.</li> </ul> <p>For more information about percentiles, please see section <a href="#">Calculating Percentiles</a><sup>2078</sup>.</p>

Include Percentiles	
Percentile	This field is only visible if percentile results are enabled above. Enter which percentile you would like to calculate. Please enter an integer value.
Percentile Average	This field is only visible if percentile results are enabled above. Enter the averaging interval in seconds that will be used for percentile calculation. Please enter an integer value.
Percentile Mode	This field is only visible if percentile results are enabled above. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Discrete:</b> Chooses the next smaller discrete value.</li> <li>▪ <b>Continuous:</b> Interpolates between discrete values.</li> </ul>

Click on **Start** to start the generation of a historic data report. **Note:** Data reporting is limited to 5 requests per minute.

### Automatic Averaging

For performance reasons, PRTG automatically averages monitoring data when calculating data for large time spans. Data is then averaged regardless of the selected average interval.

Time Span in Report	Minimum Level of Detail (Average Interval)
Up to 40 days	Any
40 to 500 days	60 minutes/1 hour or larger

A report for a time span of more than 500 days is not possible. If you try to set a larger time span, it will be reduced to 365 days automatically.

### Related Topics

- [Review Monitoring Data](#)  124
- [Reports](#)  1775

## 5.8 Similar Sensors

With PRTG you can detect relationships between different components in your network. This function is called **similar sensors analysis**, a heuristic calculation showing similar behavior of your sensors. The analysis is completely automated and sensor type agnostic. It is based on mathematics and fuzzy logic. This feature will help you to find interconnections in your network you were not aware of and optimizes your sensor usage by tracking redundant monitoring of some aspects of your system.

You can adjust the depth of similar sensors analysis in [System Administration—Monitoring](#) <sup>1840</sup>. You can toggle on/off similarity analysis on group basis in the settings of an object (probes, groups, devices) in the device tree.

There are two possibilities to view similar sensors:

- Each sensor's overview page contains a similar sensors section. PRTG lists channels there which show similarities to channels of the current sensor.
- In addition, you can call a similar sensors overview page via **Sensors | Similar Sensors Overview** from the [main menu](#) <sup>178</sup>.

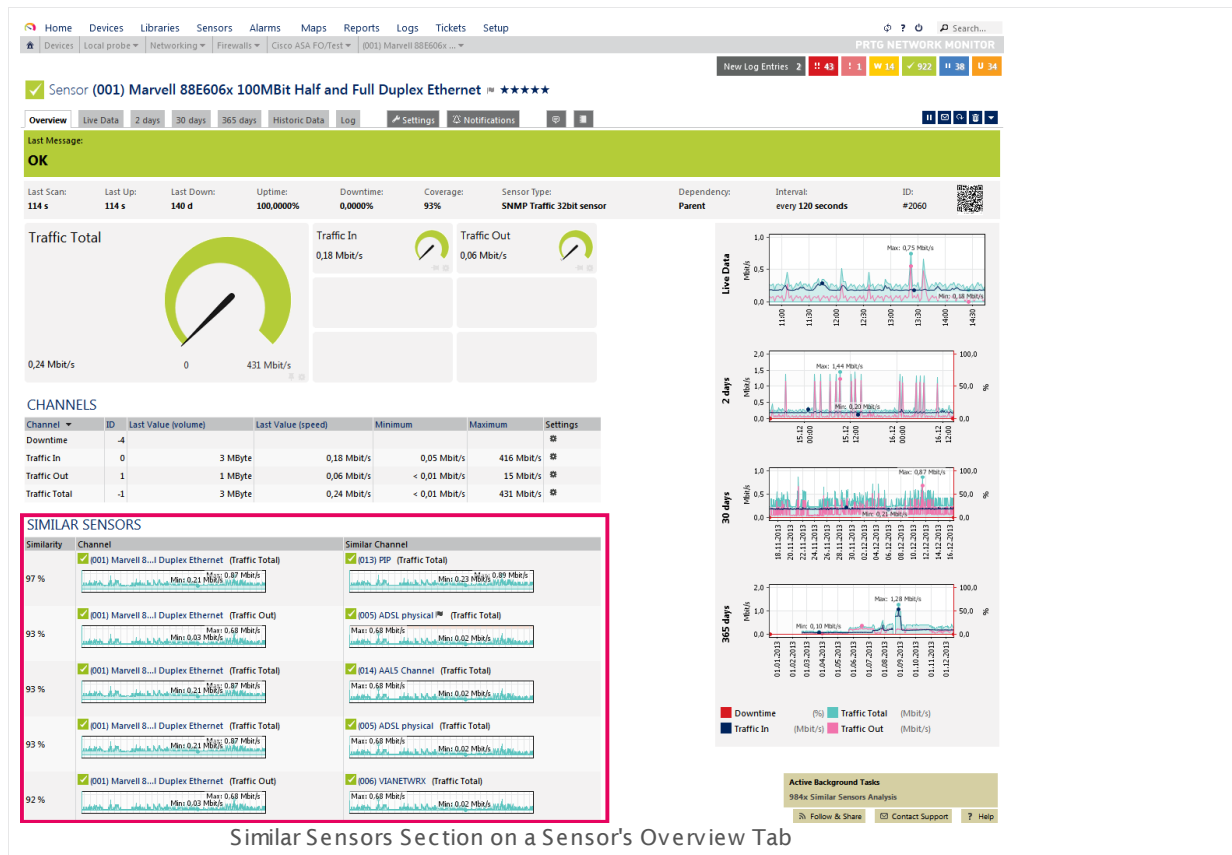

### Similar Sensors (Sensor Overview Tab)

Pages of probes, groups, device, and sensors have a tab-like interface. Using the tabs you can navigate through various sub-pages of an object in order to show your network's status, view monitoring results, or change settings.

On the overview tab of a sensor, PRTG lists channels which show similarities to channels of the currently selected sensor. The table will be empty if PRTG detects no similarities regarding the selected sensor.

**Note:** PRTG will only show similar sensors here when channels have at least 85% similarity. Furthermore, the analysis saves up to 15 entries per sensor at most.

Similar Sensors Section on a Sensor's Overview Tab

The similar sensors section provides the following information:

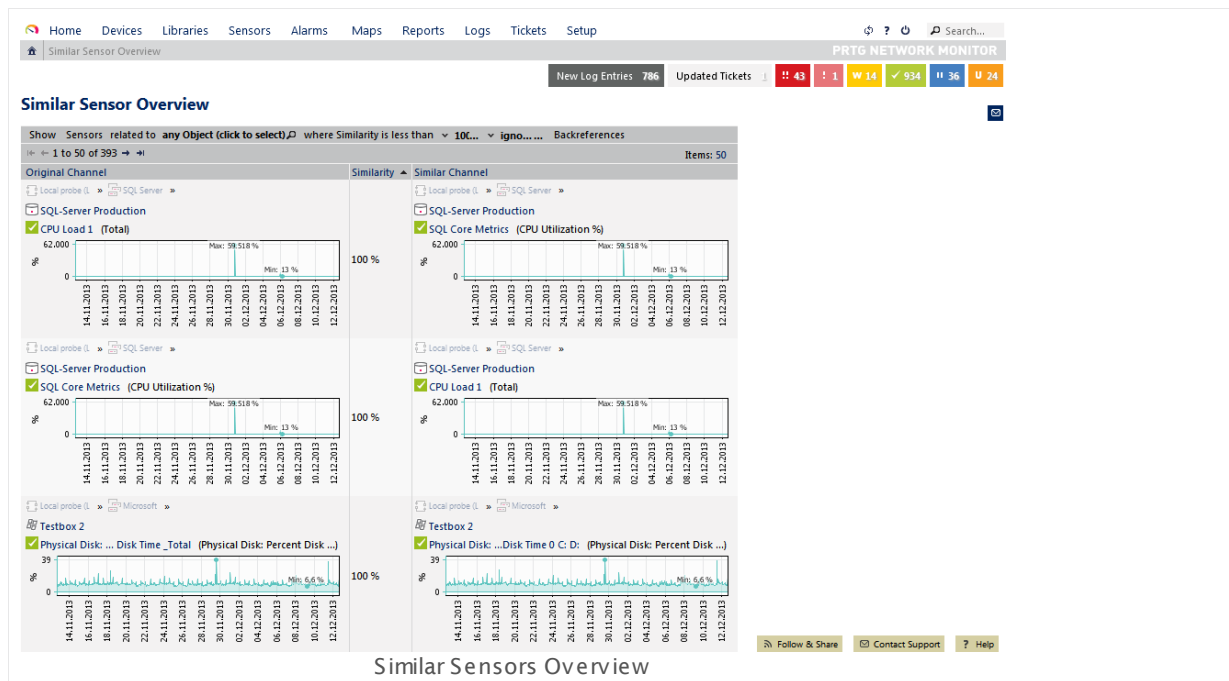

Similar Sensors	
Similarity	Shows a measurement of similarity between two channels in percent.
Channel	Shows a channel of the currently selected sensor.
Similar Channel	Shows a channel of another sensor similar to a channel of the currently selected sensor (the one in the "Channel" column in the same row).

**Note:** The similar sensors section will not be shown when the analysis is turned off or you have exceeded 1,000 sensor and selected the automatic analysis depth option.

## Similar Sensors Overview (Sensors Menu)

This page shows the results of the similar sensors analysis from the entire monitoring database. PRTG will list all channels with similarities to another one here. On the table top, you have several filter options to display similar sensors as you need it. Choose the object of interest, the degree of similarity, and if you want to display back references. For more details, see also section [Working with Table Lists](#) <sup>156</sup>.

**Note:** PRTG will only show similar sensors here when channels have at least 85% similarity. Furthermore, the analysis saves up to 15 entries per sensor at most.

You can sort the list by clicking on the column headers. The similar sensors overview page provides the following information:

### Similar Sensors Overview

#### Original Channel

Shows channels to which other channels are compared. Clicking on the column header sorts the list according to the order on the device tree in ascending or descending order.

#### Similarity

Shows a measurement of similarity between two channels in percent. Clicking on the column header sorts the list according to the similarities in ascending or descending order.

Similar Sensors Overview	
Similar Channel	Shows a channel compared to the original channel. Clicking on the column header sorts the list according to the order on the device tree in ascending or descending order.
Item Count	Define how many channel similarities are shown on this page. Choose between <b>50</b> , <b>100</b> , or <b>500</b> .

**Note:** The similar sensors overview option will not be shown in the main menu when the analysis is turned off or you have exceeded 1,000 sensor and selected the automatic analysis depth option.

## 5.9 Object Settings

Pages of probes, groups, device, and sensors have a tab-like interface. Using the tabs you can navigate through various sub-pages of an object in order to show your network's status, view monitoring results, or change settings.

### Device Tree Management

The **Management** tab is available when viewing probes or groups. After clicking this tab you can move devices and sensors right within the tree view. If moving is not possible, the web interface will start a clone process automatically.

For more information, please see [Manage Device Tree](#) <sup>222</sup> section.

### General Settings

In the **Settings** tab you can define all settings of the current object. The available options vary, depending on the kind of object you're changing. Please see the following sections for information about the respective object types:

- [Root Group Settings](#) <sup>224</sup>
- [Probe Settings](#) <sup>238</sup>
- [Group Settings](#) <sup>253</sup>
- [Device Settings](#) <sup>272</sup>
- [Sensor Settings](#) <sup>290</sup>

**Note:** The available setting options are different for **each** sensor, but always the same for probes, groups, and devices. [Sensor Channels Settings](#) <sup>1709</sup> are not reachable via tab but directly on a sensor's overview page via channel gauges and the channels table.

### Notifications Settings

In the **Notifications** tab, notification triggers can be set for every object. When using these settings for a probe, group, or device, they will be inherited to all sensors on these objects. Available notification trigger options are the same for all objects.

For more information, please see [Sensor Notifications Settings](#) <sup>1716</sup> section.

### Comments

In the **Comments** tab you can enter free text for each object. This can be used for documentation purposes or to leave information for other users.

## History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the PRTG user which conducted the change, and a message. The history log keeps the last 100 entries.

**Note:** On some pages, you can access the history of subordinate objects via the according context button in the [page header bar](#)<sup>113</sup>. This includes [System Administration](#)<sup>1831</sup> and the overview pages of [User Accounts](#)<sup>1856</sup>, [User Groups](#)<sup>1861</sup>, [Reports](#)<sup>1775</sup>, [Libraries](#)<sup>1759</sup>, and [Maps](#)<sup>1794</sup>. See section [Logs \(Main Menu\)](#)<sup>147</sup> for details.

## Related Topics

- [General Layout](#)<sup>108</sup>
- [Review Monitoring Data](#)<sup>124</sup>
- [Toplists](#)<sup>1728</sup>

## 5.10 Alarms

The Alarm list shows all sensors that are currently in a **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. Sensors in other states (for example, **Up**, **Paused**, or **Unknown**) do not appear here. This is useful to keep track of all irregularities in your network.

In the table list, you can re-sort the items by clicking on the column's header items.

The screenshot displays the 'Alarms List' in the PRTG Network Monitor interface. At the top, there's a navigation bar with tabs like Home, Devices, Libraries, Sensors, Alarms, Maps, Reports, Logs, Tickets, and Setup. Below this, a summary bar shows 'New Log Entries 45' and a status overview with icons for different alarm levels. The main section is titled 'Sensors With Alarms' and contains a table with the following columns: 'Down for', 'Probe Group Device', 'Sensor', 'Last Value', 'Status', 'Message', 'Priority', 'Graph', and 'Items'. The table lists several sensors with their respective alarm details, such as 'PING 1' being 'Down (Acknowledged)' and 'Syslog Receiver' being in 'Warning' status. At the bottom of the table, there are links for 'Follow & Share', 'Contact Support', and 'Help'.

There are two possibilities to call the alarms list: Either you click on the **Alarms** tab on the detail page of a probe, group, or device (not available for sensors), or you choose the **Alarms** entry in the main menu.

### Alarms (Object Tab)

Pages of probes, groups, device, and sensors have a tab-like interface. Using the tabs you can navigate through various sub-pages of an object in order to show your network's status, view monitoring results, or change settings.

The screenshot shows a 'Tabs Bar on Group and Probe Level'. It features a series of tabs: 'Overview', '2 days', '30 days', '365 days', 'Alarms', 'Log', 'Management', 'Settings', and 'Notifications'. The 'Alarms' tab is highlighted, indicating it is the active view. Below the tabs, there are icons for chat and help.

On an object's detail view, click on the **Alarms** tab to show a table list of all sensors **on this object** that currently show a **Down**, **Down (Partial)**, **Warning**, or **Unusual** status. You will see a subset of sensors in an alarm state for the current object only. This is a subset of the entries available via the **Alarms | All** option in [main menu](#)<sup>[18]</sup>. The tab is not available on a sensor's detail page.

## Alarms (Main Menu)

Click the **Alarms** entry from the [main menu](#) <sup>181</sup> to show a table list of **all** sensors in your configuration that currently show a **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. You can also show these sensors as gauges. **Hover** the **Alarms** entry and select another option to only show a subset of sensors in certain states. Choose between:

- **All**  
Shows a list of all sensors which currently show a **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status.
- **Show as Gauges**  
Shows the gauges of all sensors which currently show a **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. The size of the sensor gauges corresponds to their respective priority.
- **Errors Only**  
Shows a list of all sensors which currently show a **Down**, **Down (Partial)**, or **Down (Acknowledged)** status.
- **Warnings Only**  
Shows a list of all sensors which currently show a **Warning** status.
- **Unusuals Only**  
Shows a list of all sensors which currently show an **Unusual** status.

## Acknowledge Alarm

An acknowledged alarm will show up in the alarms list as "acknowledged" (see [Sensor States](#) <sup>121</sup>) and will not [trigger](#) <sup>1716</sup> any more [notifications](#) <sup>1749</sup>. **Note:** If the alarm condition clears, the sensor will usually return into an **Up** status immediately with the next sensor scan.

In order to acknowledge an alarm, right-click on a sensor and choose **Acknowledge Alarm...** from the context menu, enter a message and click the **OK** button. The message will appear in the sensor's last message value. You can choose between: **Acknowledge Indefinitely...**, **acknowledge For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Until...**

If you choose **Until...** a popup window will appear:

Acknowledge Alarm until	
Selected Objects	Shows the sensor(s) for which you want to acknowledge the alarm. You can acknowledge alarms for more than one sensor using <a href="#">multi-edit</a> <sup>1736</sup> .
Message	Enter a text, for example, the reason why you acknowledge the alarm.

**Acknowledge Alarm until****Until**

Enter the date when the acknowledge status will end. Use the date time picker to enter the date and time. **Note:** If the alarm condition still persists after the specified date, the sensor will show a **Down** status again.

Only [users](#) with write access rights may acknowledge alarms. Read-only users can be given the right to acknowledge alarms, too. See section [User Accounts Settings](#), section **Account Control**.

**More**

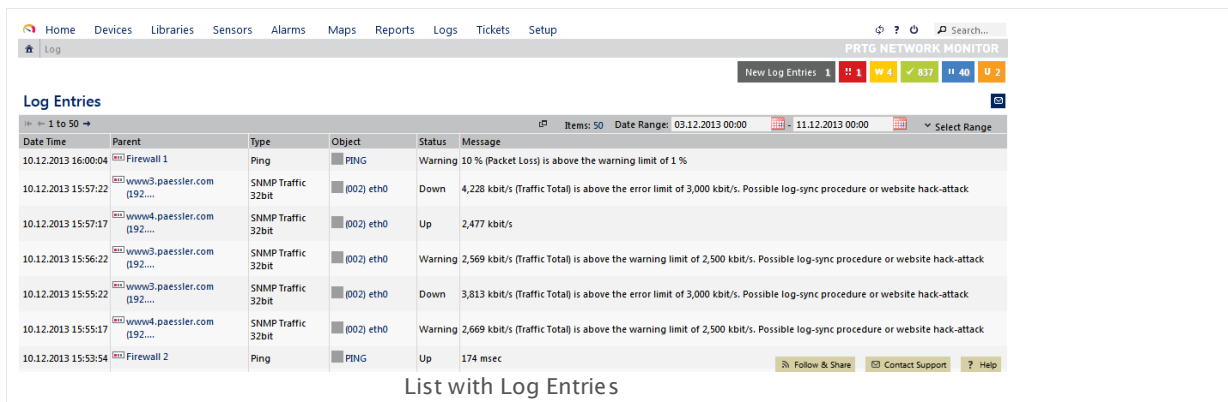

Knowledge Base: Which audible notifications are available in PRTG? Can I change the default sound?

- <http://kb.paessler.com/en/topic/26303>

## 5.11 Logs

The Logs list shows all past activities and events of your PRTG monitoring setup. This is useful to keep track of all important activities and, for example, to check whether messages were sent, etc. In a typical setup, a huge amount of data is produced here. As the activity of every single object is minuted, you can use this data to check exactly if your setup works as expected.

To support you when viewing the log files, there are several filters available. Please see [Working with Table Lists](#)<sup>156</sup> section for more information.

Log Entries

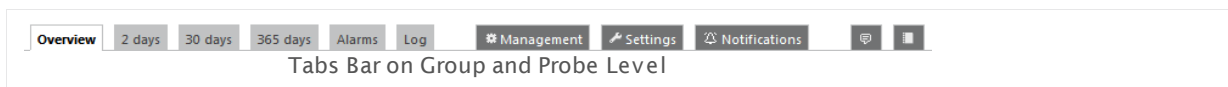

Date Time	Parent	Type	Object	Status	Message
10.12.2013 16:00:04	Firewall 1	Ping	PING	Warning	10 % (Packet Loss) is above the warning limit of 1 %
10.12.2013 15:57:22	www3.paessler.com (192...)	SNMP Traffic 32bit	(002) eth0	Down	4,228 kbit/s (Traffic Total) is above the error limit of 3,000 kbit/s. Possible log-sync procedure or website hack-attack
10.12.2013 15:57:17	www4.paessler.com (192...)	SNMP Traffic 32bit	(002) eth0	Up	2,477 kbit/s
10.12.2013 15:56:22	www3.paessler.com (192...)	SNMP Traffic 32bit	(002) eth0	Warning	2,569 kbit/s (Traffic Total) is above the warning limit of 2,500 kbit/s. Possible log-sync procedure or website hack-attack
10.12.2013 15:55:22	www3.paessler.com (192...)	SNMP Traffic 32bit	(002) eth0	Down	3,813 kbit/s (Traffic Total) is above the error limit of 3,000 kbit/s. Possible log-sync procedure or website hack-attack
10.12.2013 15:55:17	www4.paessler.com (192...)	SNMP Traffic 32bit	(002) eth0	Warning	2,669 kbit/s (Traffic Total) is above the warning limit of 2,500 kbit/s. Possible log-sync procedure or website hack-attack
10.12.2013 15:53:54	Firewall 2	Ping	PING	Up	174 msec

List with Log Entries

There are two possibilities to call the logs list: Either you click on the **Log** tab on the detail page of a probe, group, device, or sensor, or you choose the **Logs** entry in the main menu.

### Log (Object Tab)

Pages of probes, groups, device, and sensors have a tab-like interface. Using the tabs you can navigate through various sub-pages of an object in order to show your network's status, view monitoring results, or change settings.

Tabs Bar on Group and Probe Level

On an object's detail view, click on the **Log** tab to show a table list with all log information **on this object**. This is a more detailed log than the system log available via the **Logs | All** option in [main menu](#)<sup>183</sup>.

### Logs (Main Menu)

Click the **Logs** entry from the [main menu](#)<sup>183</sup> to show a table list of all system log entries in your configuration. **Hover** the Logs entry and select another option to only show a subset of entries for certain objects for certain kind of entries. Choose between:

- **All**  
Show log information for all objects in your configuration, newest first.

- **By Group ›**  
Show log information for objects in a certain group only, newest first. **Hover** to show other menu items. Select **All**, or follow the menu path (it is specific to your setup) to select a group you would like to show log information for.
- **Status Changes ›**  
Show log information for certain status changes only. **Hover** to show other menu items. Follow the menu path to view log entries with a special value in the **Status** field only. Select between **Up & Down** (shows entries with either **Up** or **Down** in the **Status** field), **Down**, **Warning**, **Unusual**, **Up**, **Paused/Resumed** (shows entries with either **Paused** or **Resumed** in the **Status** field), or **Acknowledged Alarms**.
- **System Events ›**  
Show log information regarding certain system event types only. **Hover** to show other menu items. Select between the following event types: **Probe Related**, **Cluster Related**, **Auto-Discovery**, **Notifications**, or **Status Messages**.
- **Object History**  
Shows information about changes to the PRTG setup and lists deletions of subordinate system objects. The object history page has a tab-like interface. Using the tabs you can navigate through various sub-pages in order to view the changes to all related settings and deletions of objects. Select between the following tabs: **My Account**, **System Setup**, **Notifications**, **Schedules**, **User Accounts**, **User Groups**, **Reports**, **Libraries**, or **Maps**.  
**Note:** You can open a specific tab directly with the context button **History** in the [page header bar](#) <sup>[113]</sup> on the corresponding pages.

## 5.12 Tickets

PRTG Network Monitor includes its own ticket system. With tickets you can manage and maintain various issues which may appear while monitoring a network. A ticket in PRTG contains information about recent events in your PRTG installation which need a closer look by the administrator or another responsible person. You can see each ticket as a task for a particular PRTG user.

Each monitoring related task has a lifecycle in the ticket system. PRTG itself can create tickets, for example, when [Auto-Discovery](#)<sup>[190]</sup> has finished, as well as PRTG users can create tickets for every kind of issue. In addition, you can set up notifications which open a ticket when something uncommon occurs in your network. The task gets alive when a ticket is created. Responsible PRTG users then take care of this issue. Once the issue has been resolved, the ticket can be closed and the lifecycle of the task ends.

Every ticket has a unique ID, a priority, and a status, and you can take several actions on each ticket. You should view every ticket and conduct a corresponding action. This way, you always keep an overview about each task and its history in your PRTG installation.

PRTG can also send an email to you whenever there is a ticket assigned to you or one of your tickets has been changed. See section [Tickets as Emails](#)<sup>[153]</sup> for details and how to turn off emails about tickets.

The screenshot displays the 'Tickets' section of the PRTG Network Monitor web interface. The top navigation bar includes links for Home, Devices, Libraries, Sensors, Alarms, Maps, Reports, Logs, Tickets, and Setup. Below the navigation bar, there are summary statistics: 44 tickets, 10 critical, 14 warning, 909 resolved, 36 pending, and 32 urgent. The main area shows a table of tickets with the following columns: Last modified, Priority, Ticket ID, Subject, Assigned to, Status, Object, and Actions. The table lists 20 tickets, mostly related to software updates and system reports. At the bottom of the table, there is a 'List of Tickets' label.

Last modified	Priority	Ticket ID	Subject	Assigned to	Status	Object	Actions
3 h 17 m ago	★★★★★	#1285	Software update available for PRTG Network Monitor	PRTG Administrators	Open	System	Edit, Assign, Resolve, Close
13 h 56 m ago	★★★★★	#1284	Auto-Discovery finished for "acronismprotect.pae...de (Acronis Appliance)"	PRTG Administrators	Open	acronismprotect.pae...de (Acronis Appliance)	Edit, Assign, Resolve, Close
23 h 48 m ago	★★★★★	#1283	Software update is not available	PRTG Administrators	Open	System	Edit, Assign, Resolve, Close
09.12.2013 00:00:17	★★★★★	#1282	Report finished	PRTG Administrators	Open	Report	Edit, Assign, Resolve, Close
05.12.2013 12:48:19	★★★★★	#1281	Software update available for PRTG Network Monitor	PRTG Administrators	Open	System	Edit, Assign, Resolve, Close
04.12.2013 12:47:12	★★★★★	#1280	Software update available for PRTG Network Monitor	PRTG Administrators	Open	System	Edit, Assign, Resolve, Close
04.12.2013 06:37:36	★★★★★	#1279	Flow processor buffer full (code: PE110)	PRTG Administrators	Open	NetFlow V9 1	Edit, Assign, Resolve, Close
03.12.2013 12:46:24	★★★★★	#1278	Software update available for PRTG Network Monitor	PRTG Administrators	Open	System	Edit, Assign, Resolve, Close
03.12.2013 11:20:11	★★★★★	#1277	Auto-Discovery finished for "NPIA22D0B (Support Printer) [HP Printer]"	PRTG Administrators	Open	NPIA22D0B (Support Printer) [HP Printer]	Edit, Assign, Resolve, Close
02.12.2013 15:07:22	★★★★★	#1274	Software update is not available	PRTG Administrators	Open	System	Edit, Assign, Resolve, Close
02.12.2013 00:00:35	★★★★★	#1273	Report finished	PRTG Administrators	Open	Report	Edit, Assign, Resolve, Close
29.11.2013 12:43:04	★★★★★	#1272	Software update available for PRTG Network Monitor	PRTG Administrators	Open	System	Edit, Assign, Resolve, Close
27.11.2013 12:40:33	★★★★★	#1271	Software update available for PRTG Network Monitor	PRTG Administrators	Open	System	Edit, Assign, Resolve, Close
25.11.2013 16:18:57	★★★★★	#1270	Flow processor buffer full (code: PE110)	PRTG Administrators	Open	NetFlow V9 1	Edit, Assign, Resolve, Close
25.11.2013 15:16:26	★★★★★	#1269	Report finished	PRTG Administrators	Open	Top 100 Uptime/Downtime Report	Edit, Assign, Resolve, Close
25.11.2013 15:08:09	★★★★★	#1268	Software update is not available	PRTG Administrators	Open	System	Edit, Assign, Resolve, Close
25.11.2013 15:00:35	★★★★★	#1267	Report finished	PRTG Administrators	Open	Firewall Report	Edit, Assign, Resolve, Close
25.11.2013 14:00:58	★★★★★	#1266	Report finished	PRTG Administrators	Open	Firewall Report	Edit, Assign, Resolve, Close

List of Tickets

**Note:** You can turn off the tickets system for particular user groups in [System Administration—User Groups](#)<sup>[1861]</sup> except for the PRTG Administrators group. The users in the admin group will not receive new ToDo tickets (and notifications about changes) by default but only the PRTG System Administrator user. You cannot change this behavior. However, you can [turn off ticket emails](#)<sup>[153]</sup> for every user account.

## Types of Tickets

New tickets are created in the following cases:

- New devices or sensors have been created by the auto-discovery process. **Note:** In the corresponding ticket, only device templates will be listed through which PRTG created sensors.
- A new probe connects to the core and must be acknowledged.
- A new cluster node connects to the cluster and must be acknowledged.
- A new version of the software is available.
- A new report is ready for review.
- In a few other situations, such as when the system runs out of disk space, for licensing issues, when an error occurred, etc.
- A [notification](#)<sup>[1749]</sup> opened a ticket if set in the notification settings.
- A user opened a ticket.

Overall, there are three types of tickets:

- **User Tickets:** Tickets created by PRTG users, for example, to assign monitoring related tasks to a particular PRTG user (or user group)
- **ToDo Tickets:** Tickets created by PRTG to show important system information and in case of specific system events. They are assigned to the PRTG System Administrator user and cannot be turned off.  
**Note:** The **Related Object** of ToDo tickets is **System**.
- **Notification Tickets:** Tickets created via [Notifications](#)<sup>[1749]</sup> in case of monitoring alerts

## States of Tickets

Tickets can have three different states depending on the working process regarding the corresponding issue:

- **Open:** New tickets will be open as long as the corresponding issue exists as described in the ticket.
- **Resolved:** The issue as described in the ticket does not persist any longer. Someone took care of it.
- **Closed:** Usually, the ticket has been resolved before, the solution to the issue has been checked for correctness, and the ticket does not require any other action.

## Tickets (Main Menu)

**Note:** This option is only shown in the main menu bar if the user group of the current user is allowed to use the ticket system. You can turn off tickets for particular user groups in [System Administration—User Groups](#)<sup>[186]</sup>. Users with **read-only** rights are always excluded from the ticket system and cannot see the tickets entry in the main menu bar.

You have several options to display a list of tickets which is filtered to your needs. In the [main menu bar](#)<sup>[175]</sup>, **hover** on **Tickets** to show all available filter options or **click** directly to show all tickets assigned to the current user. You can also create a new ticket via the main menu. Available options are:

- **My Tickets**  
**Click** to show all open tickets which are assigned to the current user. **Hover** to show other menu items for filtering these tickets depending on their status:
  - Open
  - Resolved
  - Closed
  - All
- **All Tickets**  
**Click** to show all open tickets of all PRTG users. **Hover** to show other menu items for filtering these tickets depending on their status:
  - Open
  - Resolved
  - Closed
  - All
- **ToDo Tickets**  
**Click** to show all open tickets from the [type](#)<sup>[150]</sup> **ToDo**. **Hover** to show other menu items for filtering these tickets depending on their status:
  - **Open**  
**Click** to show all open ToDo tickets. **Hover** to show other menu items for filtering these tickets depending on their event type:
    - Report Related
    - Auto-Discovery Related
    - Probe Related
    - System Errors
    - New Software Version
  - Resolved
  - Closed

- **All**
- **Open Ticket**  
This will open the **New Ticket** dialog. In the first step, select the object on which you want to focus in the ticket via the [Object Selector](#)<sup>[159]</sup>. Click on **Continue**. **Note:** You can leave this step out when using the [context menu](#)<sup>[163]</sup> of this object in the device tree to open the ticket.

In step 2, provide the following information and confirm by clicking on **Save** to create a **User Ticket**:

- **Subject:** Enter a meaningful title for the ticket which indicates the topic of the issue.
- **Assigned to:** Select a user (or user group) who will be responsible for this issue from the drop down list.
- **Priority:** Define a [priority](#)<sup>[160]</sup> from one to five stars.
- **Comments:** Enter a text message. This message should describe the issue in detail.

After selecting the desired filter or opening a new user ticket, a corresponding list of tickets will appear. In this table list, you can re-sort the items by using the [respective options](#)<sup>[156]</sup>. Additionally, you have several search options using the inline filter directly above the table. The following filters are available:

- **Ticket status:** all, open, resolved, closed
- **Ticket type:** User, ToDo, Notification
- **Concerned user(s):** Show only tickets which are assigned to a specific user or user group. There are the following types:
  - **anyone:** no user filter is applied so all tickets on this PRTG server are shown
  - **me:** show tickets which are assigned to you (the user who is currently logged in)
  - **Groups:** show tickets which are assigned to a specific user group only
  - **Users:** show tickets which are assigned to a specific user only
  - **Disallowed:** users or user groups which do not have access rights to the selected object are displayed under **Disallowed**. This for your information only; you cannot select them!
- **Relationship to a monitoring object:** Choose groups, probes, devices, sensors with the [Object Selector](#)<sup>[159]</sup>.  
**Note:** ToDo tickets are related to **System**.
- **Time span** to view tickets by last edit of a ticket: Use the date time picker to enter the date and time.

Click on the subject of a ticket to open the ticket's detail page. There you can find all related information, as well as you can conduct several actions.

The screenshot shows the PRTG Network Monitor web interface. At the top, there is a navigation bar with links: Home, Devices, Libraries, Sensors, Alarms, Maps, Reports, Logs, Tickets, and Setup. A search bar is also present. Below the navigation bar, a status bar displays various system metrics: 44, 10, 14, 909, 36, and 32. The main content area displays a ticket titled "Ticket #1279 'Flow processor buffer full (code: PE110)' Info \*\*\*\*\*". The ticket details include: Status: Open, Assigned to: PRTG Administrators, Related Object: NetFlow V9 1, Type: ToDo Ticket Info, and ID: #1279. Below the details, there are buttons for Edit, Assign, Resolve, and Close. A section titled "LAST UPDATE" shows the ticket was opened by PRTG System Administrator on 04.12.2013 06:37:36. A message states: "The flow processor has dropped flows. Try optimizing your include, exclude and filter rules (Most likely matches first, use brackets to structure the rule, use ip ranges and masks instead of separate IPs) (code: PE111)". At the bottom, there are links for Follow & Share, Contact Support, and Help. A caption at the bottom reads "An Open ToDo Ticket with Instructions".

## Actions

For best experience with PRTG, check every ticket and select appropriate actions. **Note:** Only members of user groups which have the corresponding [access rights](#)<sup>[94]</sup> can view and edit to tickets which are related to a certain monitoring object.

The following actions are available when viewing the tickets list or a specific ticket:

- **Edit:** Opens a dialog where you can change the subject and the priority of the ticket, as well as you can assign the ticket to another user. Furthermore, you can add a text message to this ticket. Confirm your changes by clicking on **Save**.
- **Assign:** Opens a dialog in which you can give the ticket to another user. Select a user (or user group) via the drop down menu. Furthermore, you can add a text message to this ticket. Confirm your assignment by clicking on **Save**.
- **Resolve:** Opens a dialog where you can resolve the ticket by clicking on **Save**. The status **resolved** indicates that the issue as described in this ticket does not persist. Furthermore, you can add a text message to this ticket which indicates, for example, what has been done concerning the issue.
- **Close:** Opens a dialog where you can close the ticket by clicking on **Save**. Usually, this ticket has been resolved before and the correct solution of the issue has been checked. Furthermore, you can add a text message to this ticket.
- **Reopen:** Opens a dialog where you can reopen a ticket after it has been resolved or closed. Do so, for example, if the solution of the issue turned out to be incorrect. Furthermore, you can add a text message to this ticket which indicates, for example, why you have opened the ticket again. Confirm reopening and assignment by clicking on **Save**.

## Tickets as Emails

You can receive all tickets which are assigned to you or to your user group as emails. You will be also notified each time this ticket is edited via email. This way, you will keep always informed about new notifications (if set), important system information (if PRTG System Administrator), or within the communication with other PRTG users. You can turn off the setting **Tickets as Emails** in [System Administration—User Accounts](#)<sup>[1856]</sup>. If you disable emails for a user account, this particular user will not receive any ticket emails anymore.

**Note:** If you have defined to get tickets as emails and you are PRTG System Administrator, you will receive emails for ToDo tickets as well, although ToDo tickets are considered to be opened by the PRTG System Administrator.

## 5.13 Working with Table Lists

Throughout the web interface often you will see table lists of items, for example, sensor or device lists. Table lists are also available in the **Overview** tab of [Libraries](#)<sup>[1759]</sup>, [Maps](#)<sup>[1794]</sup>, [Reports](#)<sup>[1775]</sup>, [Notifications](#)<sup>[1749]</sup>, and [Schedules](#)<sup>[1827]</sup>, as well as in [Logs](#)<sup>[147]</sup> and [Tickets](#)<sup>[149]</sup>. All these provide common functionality.

On certain overview pages, such as for [sensors](#)<sup>[178]</sup>, [tickets](#)<sup>[151]</sup>, and [similar sensors](#)<sup>[140]</sup>, there is also an inline filter available directly above the table. The filter options depend on the current page.

Example of a Table List

Probe Group Device	Sensor	Status	Message	Last Value	Graph	Priority	Fav.
Local probe (0) > Firewalls > Cisco ASA Primary	✓ (003) WAN	Up	OK	23 Mbit/s	Traffic Total 23 Mbit/s	★★★★★	⌵
Local probe (0) > Firewalls > Cisco ASA Primary	✓ (004) LAN	Up	OK	24 Mbit/s	Traffic Total 24 Mbit/s	★★★★★	⌵
Local probe (0) > Firewalls > Cisco ASA FO/Test	✓ (001) Marvell 88E606x 100MBIT Half and Full Duplex Ethernet	Up	OK	0,19 Mbit/s	Traffic Total 0,19 Mbit/s	★★★★★	⌵
Local probe (0) > Switches > Core Switch	✓ (012) Service NAS1	Up	OK	0,18 Mbit/s	Traffic Total 0,18 Mbit/s	★★★★★	⌵
Local probe (0) > Switches > GigabitSwitch Server	✓ (001) Ethernet Interface	Up	OK	0,20 Mbit/s	Traffic Total 0,20 Mbit/s	★★★★★	⌵
Local probe (0) > Baseline > Google Search Appliance	✓ (001) Io	Up	OK	0,38 Mbit/s	Traffic Total 0,38 Mbit/s	★★★★★	⌵

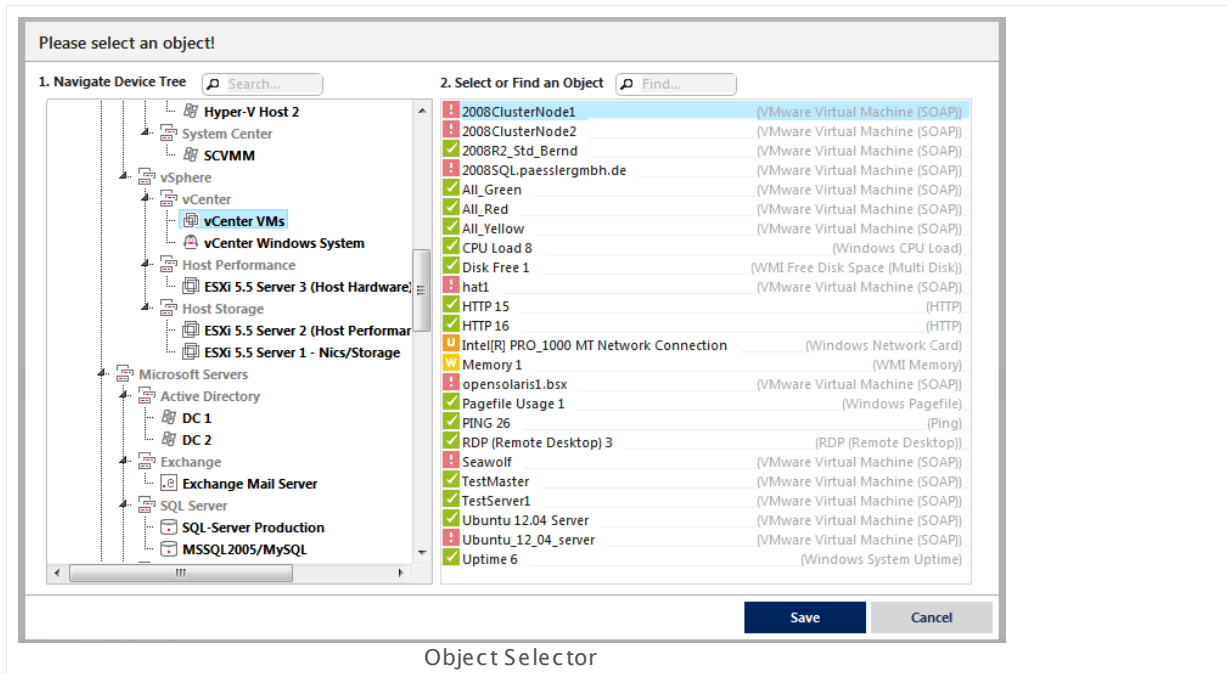

Feature	Display	What it does
Paging		The content of a table is displayed on several pages. Click on the arrow symbols at the beginning or the end of a list to view other pages, or to jump to the beginning or the end of the list.
New Window		Click on the window symbol at the beginning or the end of a list to open the table in a new window.
Date Range		Use the date time picker to show table list entries within a specific time span only. Click on the first date field for the start date and on the second field for the end date. A calendar will open where you can particularly select date and time. Click on the <b>Done</b> button to apply the selected date and time.
Select Range		When viewing log lists (not available in other lists), hover the <b>Select Range</b> option at the upper right corner of the list to select the time span you want to show log entries for. Choose between <b>Today</b> , <b>Yesterday</b> , and several other time spans. Choose <b>Unlimited</b> to disable this filter again.
Items		Hover the <b>Items</b> option at the beginning or end of the list to select how many rows are shown on each page. Choose between <b>50</b> , <b>100</b> , <b>500</b> , and <b>1000</b> .
Sorting		Click on the column headers to sort lists by the respective column.

- [Multi-Edit Lists](#) 

## 5.14 Object Selector

For some functions, the object selector is shown. It enables you to browse all objects in your configuration and select an object in two steps.

### Step 1: Navigate Device Tree

On the left hand side, you see a device tree specific to your setup that you can browse by clicking on the corresponding nodes. Click on a device to view its sensors on the right hand side.

You can directly browse for objects in the device tree by entering a probe name, group name, or device name into the **Search...** field above the device tree navigation. You can also use a substring only. The resulting objects will be displayed immediately without any manual confirmation.

### Step 2: Select an Object

If you have selected a device on the left hand side, you will see the sensors on this device here, on the right hand side. Also, the sensor type is shown. **Hover** a sensor on the right side to view its parent device and group.

You can also directly search and find sensors by entering its sensor name, group name, device name, or tag into the **Find...** box above the sensor list.

Select an object and click on the **Save** button.

## 5.15 Priority and Favorites

You can set priorities for all objects in your setup as well as categorize devices or sensors as favorites. Both settings affect how your objects will be displayed. **Note:** Settings for priority and favorites are stored for the entire installation; they are not user specific.

### Priority for All Objects

The priority setting will affect in which order your objects will be displayed when viewing table lists. Objects with a higher priority are listed first, others underneath, depending on their own priority.

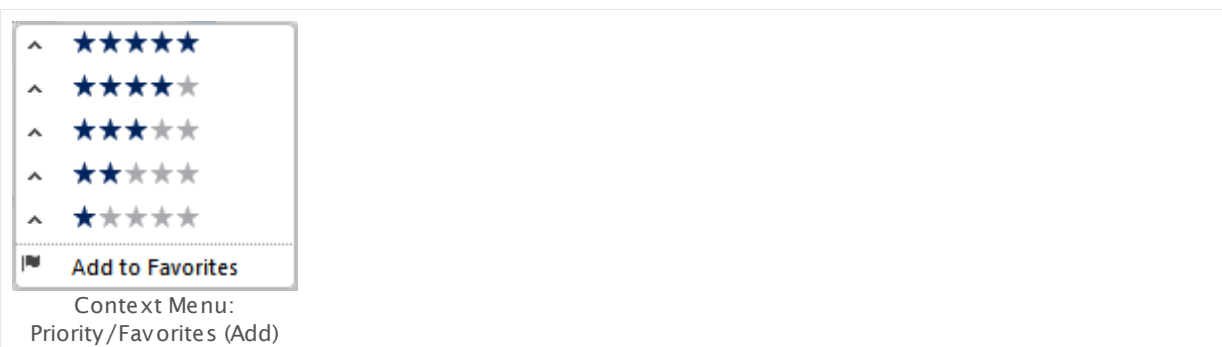

To change priority settings, **right-click** an object to open the [context menu](#)<sup>163</sup> and select **Priority**. You can choose between 5 stars **\*\*\*\*\*** (top priority) and one star **\*** (lowest priority). By default, all objects are set to medium priority (3 stars **\*\*\*)**. In the page header bar and in lists, you can set a priority directly by one click on a star, for example, for sensors on a device overview page.

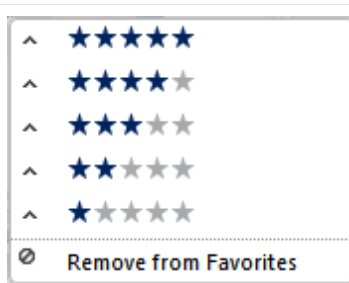

### Favorites for Devices and Sensors

To call a list of all your favorite devices or sensors, select **Devices | Favorite Devices** or **Sensors | Favorite Sensors** from the main menu. These lists are sorted by priority as well.

You can mark any device or sensor as favorite to add it to the favorite list. Right click on it to open the [context menu](#)<sup>163</sup>. Select **Priority/Favorite | Add to Favorites**. A small black flag symbol will be added next to the object's name.

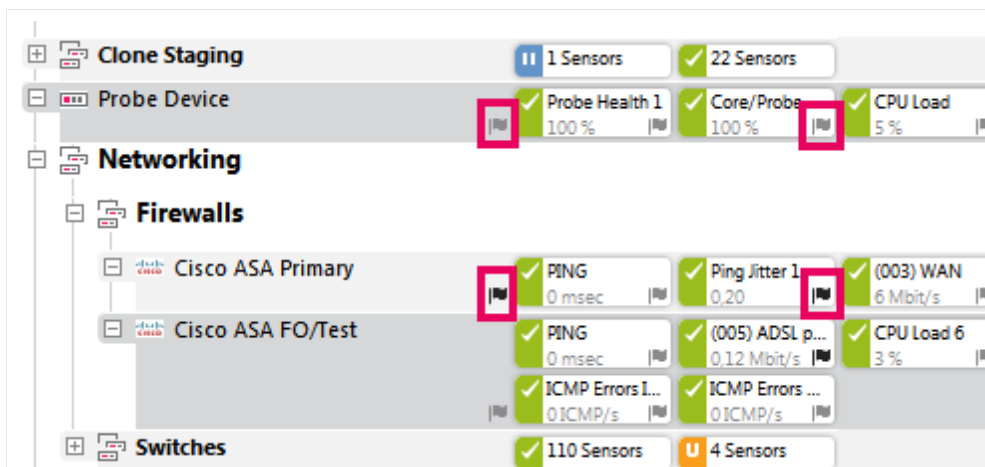

To remove an object from the favorites list, select **Priority/Favorite | Remove from Favorites** from the [context menu](#)<sup>163</sup>.

Context Menu:  
Priority/Favorites (Remove)

There is also the option to add a device or sensor to favorites by one click in the device tree. Just click on the small flag symbol right to the respective object name for this concern. If the flag is black, the specific object is already a favorite; clicking anew on the flag will remove it from favorites and the flag will turn gray again.

One-Click Adding to Favorites in the Device Tree

## Priority and Favorites in the Page Header Bar

You can add any device or sensor to favorites on its respective details page by clicking on the small flag symbol in the [page header bar](#)<sup>[113]</sup>. If the flag is black, the selected object is already a favorite; clicking anew on the flag will remove it from favorites and the flag will turn gray again. It is also possible to set the priority of the object by a click on one of the five stars in the page header; five stars \*\*\*\*\* means top priority, one star \* is the lowest priority.

Device **Cisco ASA Primary** | ★★★★★

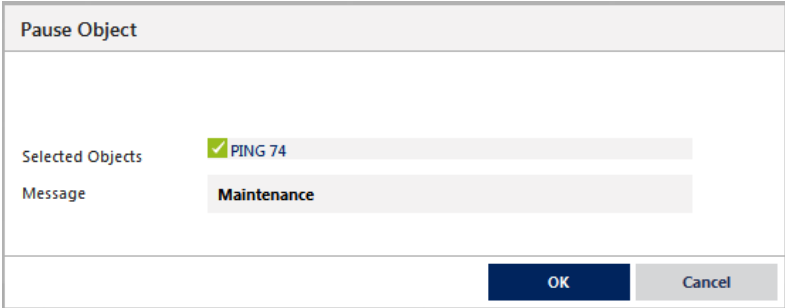

One-Click Favorite and Priority in the Page Header Bar

## 5.16 Pause

While a sensor is paused, it will not collect any monitoring data, will not change its [status](#)<sup>[121]</sup>, and will not trigger any [notifications](#)<sup>[92]</sup>. You can pause monitoring for every object by selecting **Pause** from the [context menu](#)<sup>[163]</sup> of a probe, a group, a device, or a sensor. All sensors on this object will then be paused. You can choose **Pause Indefinitely**, or select a time after which monitoring will be resumed automatically, such as **5 or 15 minutes**, **1 or 3 hours**, **1 day**, or **Until** a certain date. You can also set up a one-time maintenance window to pause sensors automatically at a specified time.

**Note:** When selecting the **Pause** symbol from an object's [hover popup](#)<sup>[174]</sup> or while using [multi-edit](#)<sup>[1736]</sup>, the object(s) will be paused indefinitely until resumed.

When selecting a pause option, you are prompted to enter a message. This will be shown in the status message of the object as long as it is paused. Confirm with **OK** to pause the object; click **Cancel** to not pause it.

PRTG Pause Message Prompt

**Note:** Monitoring for objects can also be paused by applying a schedule (see [Account Settings—Schedules](#)<sup>[1827]</sup>) in the [Object Settings](#)<sup>[142]</sup>.

### Inheritance and Resume

If you pause monitoring for an object in the [device tree](#)<sup>[108]</sup>, all child objects underneath will be paused as well. For example, when pausing a group, all sensors on all devices in it will also be paused. Once an object is paused, you can resume monitoring any time by selecting **Resume** from the [context menu](#)<sup>[163]</sup>. However, you cannot resume monitoring for single child objects that are paused by a parent object, but only for the object you originally set to pause. **Note:** Also after a restart of PRTG, a pause status will be kept.

## 5.17 Context Menus

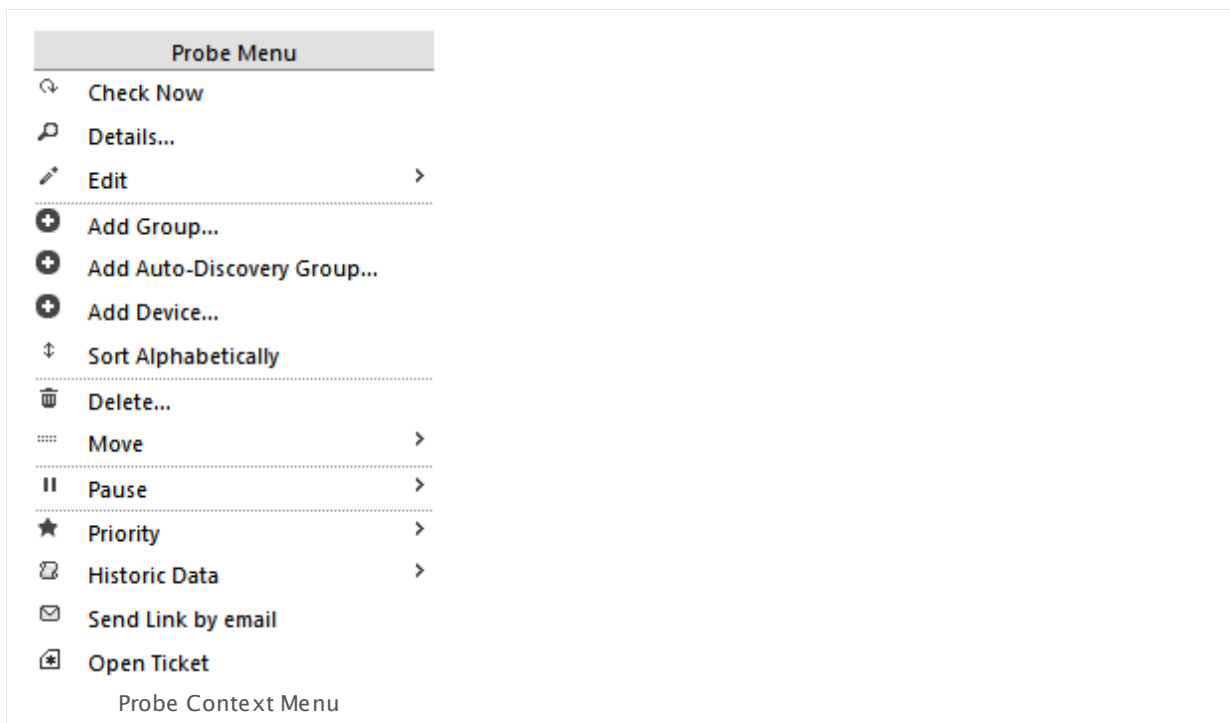

Right-click on an object to view a context menu with many options for direct access to monitoring data and functions. You can also access many of the functionalities via the [main menu](#)<sup>[175]</sup> or the [hover popup](#)<sup>[174]</sup> window. However, using the context menus is the easier way in most cases.

**Note:** In order to view your browser's context menu, hold down the **Ctrl** key (Chrome) or the **Shift** key (Firefox) while right-clicking. You will then see your browser's instead of the PRTG menu. This is not possible with Internet Explorer.

The content of the PRTG context menu varies, depending on the type of object you have selected. Please see the following sub sections for an overview of the available options.

- [Probe Context Menu](#)<sup>[163]</sup>
- [Group Context Menu](#)<sup>[166]</sup>
- [Device Context Menu](#)<sup>[168]</sup>
- [Sensor Context Menu](#)<sup>[171]</sup>

### Probe Context Menu

- **Check Now**  
This will perform an immediate scan for the selected probe. The data for all devices and sensors in the [object hierarchy](#)<sup>[83]</sup> underneath will be queried.

- **Details...**

This will show the details of the selected probe, such as its status, the groups on the selected probe, and an overview about the sensor states on the selected probe.

- **Edit >**

The edit menu will appear.

- **Edit > Settings...**

This will open the [Probe Settings](#)<sup>[238]</sup> tab.

- **Edit > Notifications...**

This will open the [Notifications](#)<sup>[1749]</sup> tab.

- **Edit > Access Rights...**

This will open a popup to edit [access rights](#)<sup>[94]</sup>.

- **Edit > Rename...**

This will open a popup to edit the name of the selected probe.

- **Edit > Management...**

This will open the [management](#)<sup>[222]</sup> tab.

- **Add Group...**

This will open an assistant which guides you through the process of adding a new group to the selected probe. For detailed instructions, please see [Add a Group](#)<sup>[205]</sup>.

- **Add Auto-Discovery Group...**

This will open an assistant which guides you through the process of adding a new auto-discovery group to your setup. PRTG will create a new group and run an auto-discovery in your network in order to add devices and sensors for these devices automatically. For more information, please see section [Using the Auto-Discovery](#)<sup>[190]</sup>.

- **Add Device...**

This will open an assistant which guides you through adding a new device to the selected probe. For detailed instructions, please see [Add a Device](#)<sup>[211]</sup>.

- **Sort Alphabetically**

This will sort direct children (groups and devices) of the selected probe in alphabetical order. The ordering will be stored in the monitoring configuration and cannot be revoked.

- **Delete...**

This will delete the selected probe. You will be asked for confirmation before anything is actually deleted.

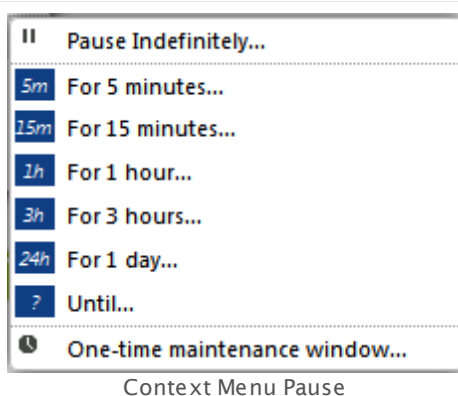

- **Move >**

The move menu will appear.

- This will move the selected probe. Choose between
  - **Move > Top**: This will move the probe to the top of the mother node (here the root group).
  - **Move > Up**: This will move the probe one entry up under the root group.
  - **Move > Down**: This will move the probe one entry down under the root group.
  - **Move > Bottom**: This will move the probe to the bottom of the root group.
  - **Move > Management...**: This will open the [management](#)<sup>[222]</sup> tab.
- **Pause >**  
The pause menu will appear.

- If the probe is already in a paused state, **Resume** will appear in the context menu instead of **Pause >**.

- You can pause and resume monitoring on the selected probe. The monitoring for all sensors in the [object hierarchy](#)<sup>[83]</sup> underneath will be paused resp. resumed. You can choose between: **Pause Indefinitely...**, **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Pause Until...**. If you choose **Pause Until...** a popup window will appear where you can define a date. Monitoring will be resumed after this date.
- You can directly add a **One-time maintenance window** to pause monitoring during a planned downtime. In the appearing window, use the date time picker to enter the start date and time of the maintenance window, as well as the end time, for the selected object.

- **Priority >**

The priority menu will appear.

- Define the priority of the selected probe. For details, please see [Priority and Favorites](#) <sup>160</sup>.

- **Historic Data >**

The historic data menu will appear.

- Depending on what time interval you choose, **Last 2 days...**, **Last 30 days...**, or **Last 365 days...**, the [Historic Data Reports](#) <sup>133</sup> tab for the specified interval will be opened.
- **Historic Data > Create Report...** will open an assistant to add a report. For details, please see [Reports Step by Step](#) <sup>177b</sup>.
- **Send Link by email**  
You can send the link to the selected probe by email. This will open a new email using your system's standard email client. It will contain a direct link to the selected probe's details page.
- **Open Ticket**  
This will open the **New Ticket** dialog. For details, see section [Tickets](#) <sup>152</sup>.

## Group Context Menu

**Note:** The context menu of the **Root** group is special and differs from the other groups' menu.

- **Check Now**  
This will perform an immediate scan for the selected group. The data for all devices and sensors in the [object hierarchy](#) <sup>83</sup> underneath will be queried.
- **Details...**  
This will show the details of the selected group, such as its status, the devices on the selected group, and an overview about the sensor states on the selected group.
- **Edit >**  
The edit menu will appear.

- **Settings...**  
This will open the [Group Settings](#)<sup>[253]</sup> tab.
- **Notifications...**  
This will open the [Notifications](#)<sup>[1749]</sup> tab.
- **Access Rights...**  
This will open a popup to edit [access rights](#)<sup>[94]</sup>.
- **Rename...**  
This will open a popup to edit the name of the selected group.
- **Management...**  
This will open the [management](#)<sup>[222]</sup> tab.
- **Add Group...**  
This will open an assistant which guides you through the process of adding a new group to the selected group. For detailed instructions, please see [Add a Group](#)<sup>[205]</sup>.
- **Add Auto-Discovery Group...**  
This will open an assistant which guides you through the process of adding a new auto-discovery group to your setup. PRTG will create a new group and run an auto-discovery in your network in order to add devices and sensors for these devices automatically. For more information, please see section [Using the Auto-Discovery](#)<sup>[190]</sup>.
- **Add Device...**  
This will open an assistant which guides you through adding a new device to the selected group. For detailed instructions, please see [Add a Device](#)<sup>[211]</sup>.
- **Run Auto-Discovery**  
If you select this option, an automatic search is started, adding new sensors to the selected group. The search is running in the background. If found, you will see new sensors after a few minutes automatically. For more information, please see [Auto-Discovery](#)<sup>[191]</sup> (**Run Auto-Discovery Now**).
- **Sort Alphabetically**  
This will sort direct children (devices and other groups) of the selected group in alphabetical order. The ordering will be stored in the monitoring configuration and cannot be revoked.
- **Delete...**  
This will delete the selected group. You will be asked for confirmation before anything is actually deleted.
- **Clone**  
This will open an assistant which guides you through cloning the selected group. For detailed instructions, please see [Clone Object](#)<sup>[1734]</sup>.
- **Move >**  
The move menu will appear.
  - This will move the selected group. Choose between:
    - **Move > Top**: This will move the group to the top of the mother node (here usually a probe or another group).
    - **Move > Up**: This will move the group one entry up under the mother node.
    - **Move > Down**: This will move the group one entry down under the mother node.
    - **Move > Bottom**: This will move the group to the bottom of the mother node.

- **Move > To Other Group:** This will move the group to another group. An assistant will appear in this case with information about the selected group and the sub-objects which also will be moved. Please choose a target group from the list.
- **Move > Management...** This will open the [management](#)<sup>[222]</sup> tab.
- **Pause >**  
The pause menu will appear.
  - If the group is already in a paused state, **Resume** will appear in the context menu instead of **Pause >**.
  - You can pause and resume monitoring on the selected group. The monitoring for all sensors in the [object hierarchy](#)<sup>[83]</sup> underneath will be paused resp. resumed. You can choose between: **Pause Indefinitely...**, pause **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Pause Until...** If you choose **Pause Until...** a popup window will appear where you can define a date. Monitoring will be resumed after this date.
  - You can directly add a **One-time maintenance window** to pause monitoring during a planned downtime. In the appearing window, use the date time picker to enter the start date and time of the maintenance window, as well as the end time, for the selected object.
- **Priority >**  
The priority menu will appear. Define the priority of the selected group. For details, please see [Priority and Favorites](#)<sup>[160]</sup>.
- **Historic Data >**  
The historic data menu will appear.
  - Depending on what time interval you choose, **Last 2 days...**, **Last 30 days...**, or **Last 365 days...**, the [Historic Data Reports](#)<sup>[133]</sup> tab for the specified interval will be opened.
  - **Historic Data > Create Report...** will open an assistant to add a report. For details, please see [Reports Step by Step](#)<sup>[178]</sup>.
- **Send Link by email**  
You can send the link to the selected group by email. This will open a new email using your system's standard email client. It will contain a direct link to the selected probe's details page.
- **Open Ticket**  
This will open the **New Ticket** dialog. For details, see section [Tickets](#)<sup>[152]</sup>.

## Device Context Menu

- **Check Now**  
This will perform an immediate scan for the selected device. The data for all sensors in the [object hierarchy](#)<sup>[83]</sup> underneath will be queried.
- **Details...**  
This will show the details of the selected device, such as its status and the sensor states on the selected device.
- **Edit >**  
The edit menu will appear.

- **Settings...**  
This will open the [Device Settings](#)<sup>[272]</sup> tab.
- **Notifications...**  
This will open the [Notifications](#)<sup>[1749]</sup> tab.
- **Access Rights...**  
This will open a popup to edit [access rights](#)<sup>[94]</sup>.
- **Rename...**  
This will open a popup to edit the name of the selected device.
- **Add Sensor...**  
This will open an assistant which guides you through adding a new sensor to the selected device. For detailed instructions, please see [Add a Sensor](#)<sup>[220]</sup>.
- **Run Auto-Discovery**  
If you select this option, an automatic search is started, adding new sensors to the selected device. The search is running in the background. If found, you will see new sensors after a few minutes automatically. For more information, please see [Auto-Discovery](#)<sup>[191]</sup> (**Run Auto-Discovery Now**).
- **Create Device Template...**  
This will open an assistant which guides you through creating a new device template; this will then be available in [auto-discovery](#)<sup>[190]</sup>. For detailed instructions, please see [Create Device Template](#)<sup>[1741]</sup>.
- **Sort Alphabetically**  
This will sort direct children (sensors) of the selected device in alphabetical order. The ordering will be stored in the monitoring configuration and cannot be revoked.
- **Delete...**  
This will delete the selected device. You will be asked for confirmation before anything is actually deleted.
- **Clone**  
This will open an assistant which guides you through cloning the selected device. For detailed instructions, please see [Clone Object](#)<sup>[1734]</sup>.
- **Move >**  
The move menu will appear. This will move the selected device. Choose between:
  - **Move > Top**: This will move the device to the top of the mother node (here usually a group or a probe).
  - **Move > Up**: This will move the device one entry up under the mother node.
  - **Move > Down**: This will move the device one entry down under the mother node.
  - **Move > Bottom**: This will move the device to the bottom of the mother node.
  - **Move > To Other Group**: This will move the device to another group. An assistant will appear in this case with information about the selected device and the sub-objects which also will be moved. Please choose a target group from the list.
- **Pause >**  
The pause menu will appear. If the device is already in a paused state, **Resume** will appear in the context menu instead of **Pause >**.

- You can pause and resume monitoring on the selected device. The monitoring for all sensors in the [object hierarchy](#)<sup>[83]</sup> underneath will be paused resp. resumed. You can choose between: **Pause Indefinitely...**, **pause For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Pause Until...**. If you choose **Pause Until...** a popup window will appear where you can define a date. Monitoring will be resumed after this date.
- You can directly add a **One-time maintenance window** to pause monitoring during a planned downtime. In the appearing window, use the date time picker to enter the start date and time of the maintenance window, as well as the end time, for the selected object.
- **Priority/Favorite >**  
The priority/favorite menu will appear. Define the priority of the selected device, or add resp. remove the device to resp. from the favorites. For details, please see [Priority and Favorites](#)<sup>[160]</sup>.
- **Historic Data >**  
The historic data menu will appear.
  - Depending on what time interval you choose, **Last 2 days...**, **Last 30 days...**, or **Last 365 days...**, the [Historic Data Reports](#)<sup>[133]</sup> tab for the specified interval will be opened.
  - **Historic Data > Create Report...** will open an assistant to add a report. For details, please see [Reports Step by Step](#)<sup>[178]</sup>.
- **Device Tools >**  
The device tools menu will appear.

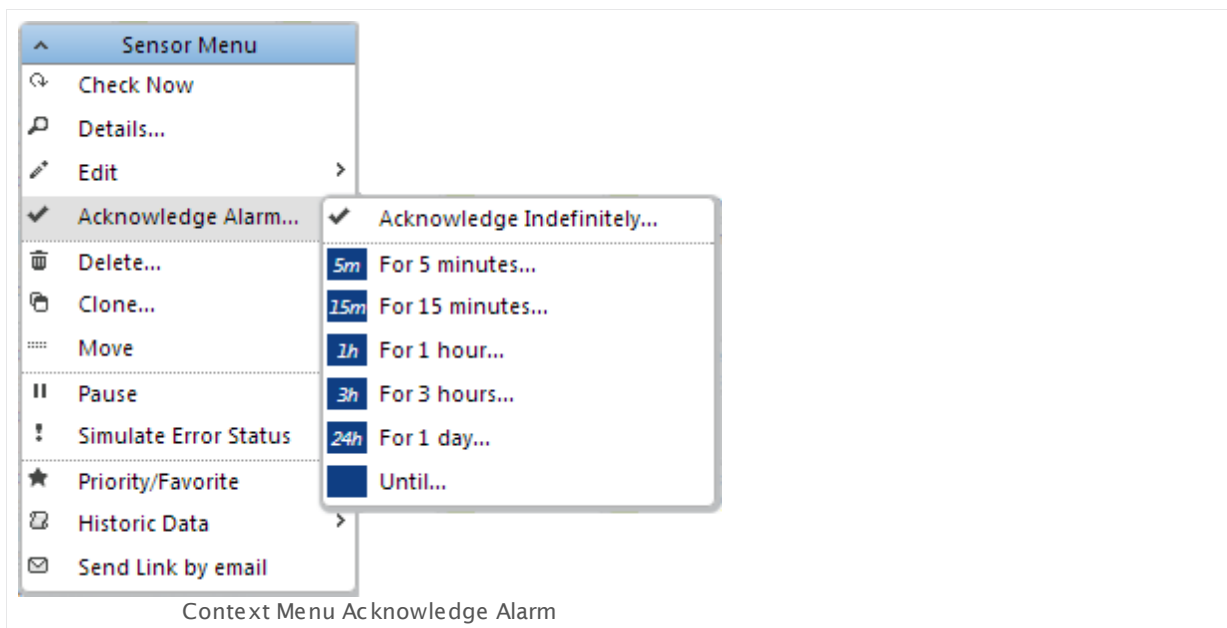

Context Menu Device Tools

- **Go To Service URL..**  
This will open the service page you have defined in the [Device Settings](#)<sup>[272]</sup>.
- **New window with HTTP...**  
This will open a new browser window with Hypertext Transfer Protocol (HTTP) and the IP address / DNS name of the device.
- **New window with HTTPS...**  
This will open a new browser window with Hypertext Transfer Protocol Secure (HTTPS) and the IP address / DNS name of the device.
- **New window with FTP...**  
This will open a new browser window with File Transfer Protocol (FTP) and the IP address / DNS name of the device.

- **Remote Desktop...**  
This will download a .rdp file. When you execute the file remote desktop will start with the IP address / DNS name of the device. **Note:** In Firefox you have to use mstsc.exe (Microsoft Terminal Service) to open the file.
- **Traceroute...**  
This will start a traceroute on the selected device. PRTG will display the route and measure transit delays of packets across the IP network.
- **Install Remote Probe...**  
This will open an assistant to install a **Remote Probe** of PRTG on this device. For more details, please see [Remote Probe Quick Install](#) .
- **Find Duplicates...**  
Search in your PRTG configuration for devices with the same IP address or DNS name as the selected device. A window with the results will appear, either showing existing duplicates or a message indicating that there are no duplicates.
- **Send Link by email**  
You can send the link to the selected device by email. This will open a new email using your system's standard email client. It will contain a direct link to the selected probe's details page.
- **Open Ticket**  
This will open the **New Ticket** dialog. For details, see section [Tickets](#) .

## Sensor Context Menu

- **Check Now**  
This will perform an immediate scan for the selected sensor.
- **Details...**  
This will show the details of the selected sensor, such as its status and channels.
- **Edit ›**  
The edit menu will appear.
  - **Settings...**  
This will open the [Sensor Settings](#)  tab.
  - **Notifications...**  
This will open the [Notifications](#)  tab.
  - **Access Rights...**  
This will open a popup to edit [access rights](#) .
  - **Rename...**  
This will open a popup to edit the name of the selected device.
- **Acknowledge Alarm ›**  
This option is available only in the sensor context menu when a sensor in a **Down** or **Down (Partial)** status is selected.

Context Menu Acknowledge Alarm

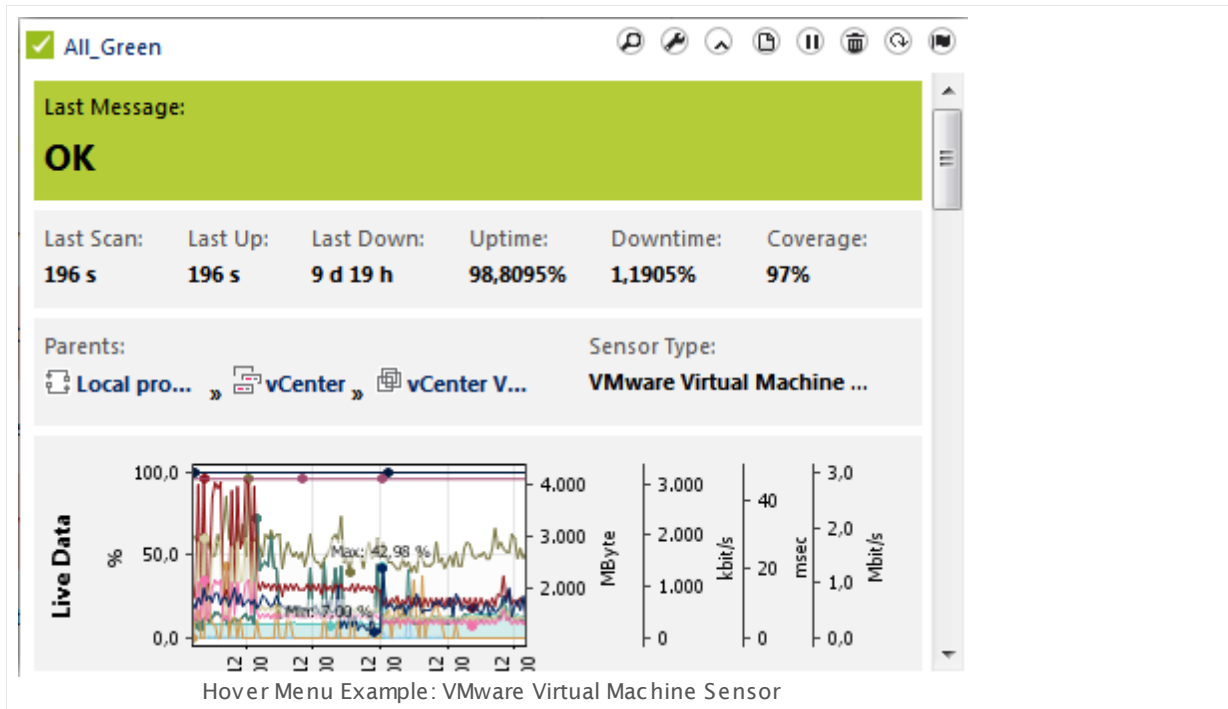

- You can acknowledge an alarm for the selected sensor. An acknowledged alarm will show up in the alarms list as "acknowledged" (see [Sensor States](#)<sup>[121]</sup>) and will not [trigger](#)<sup>[1716]</sup> any more [notifications](#)<sup>[1749]</sup>. You can choose between: **Acknowledge Indefinitely...**, **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Until...**. If you choose **Until...** a popup window will appear where you can define a date. If the alarm condition still exists after this date, the sensor will show a **Down** status again. **Note:** If the alarm condition clears, the sensor will usually return into an **Up** status immediately with the next sensor scan. For details about acknowledging an alarm, please see [Alarms](#)<sup>[145]</sup> section.
- **Delete...**  
This will delete the selected sensor. You will be asked for confirmation before anything is actually deleted.
- **Clone**  
This will open an assistant which guides you through cloning the selected sensor. For detailed instructions, please see [Clone Object](#)<sup>[1734]</sup>.
- **Move >**  
The move menu will appear. This will move the selected sensor. Choose between:
  - **Move > Top:** This will move the sensor to the top of the mother node (here a device).
  - **Move > Up:** This will move the sensor one entry up under the device.
  - **Move > Down:** This will move the sensor one entry down under the device.
  - **Move > Bottom:** This will move the sensor to the bottom of the device.
- **Pause >**  
The pause menu will appear. If the sensor is already in a paused state, **Resume** will appear in the context menu instead of **Pause >**.

- You can pause and resume monitoring on the selected sensor. You can choose between: **Pause Indefinitely...**, pause **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Pause Until...**. If you choose **Pause Until...** a popup window will appear where you can define a date. Monitoring will be resumed after this date.
- You can directly add a **One-time maintenance window** to pause monitoring during a planned downtime. In the appearing window, use the date time picker to enter the start date and time of the maintenance window, as well as the end time, for the selected object.
- **Simulate Error Status**  
This will set the selected sensor to a simulated error state. As for the paused state, **Resume** will appear in the context menu if a the selected sensor is already in a simulated error state.
- **Priority/Favorite >**  
The priority/feature menu will appear.
  - Define the priority of the selected sensor. For details, please see [Priority and Favorites](#) <sup>160</sup>.
- **Historic Data >**  
The historic data menu will appear.
  - Depending on what time interval you choose, **Last 2 days...**, **Last 30 days...**, or **Last 365 days...**, the [Historic Data Reports](#) <sup>133</sup> tab for the specified interval will be opened.
  - **Historic Data > Create Report...** will open an assistant to add a report. For details, please see [Reports Step by Step](#) <sup>178</sup>.
- **Send Link by email**  
You can send the link to the selected sensor by email. This will open a new email using your system's standard email client. It will contain a direct link to the selected probe's details page.
- **Open Ticket**  
This will open the **New Ticket** dialog. For details, see section [Tickets](#) <sup>152</sup>.

## 5.18 Hover Popup

Whenever you rest the mouse pointer for a second over an object's icon in the [device tree](#)<sup>[108]</sup>, a hover popup window will appear, showing details about this object. It contains information from the object's [overview tab](#)<sup>[124]</sup>, as well as several graphs. The exact information provided depends on the kind of object you are hovering.

**Note:** The hover popup does only appear if your browser is the currently focused window on your desktop. It disappears with every (automatic) page refresh.

### Menu Icons

At the top of the hover popup window, several icons are shown which enable you to view or edit the current object. These are the most important options from this object's [context menu](#)<sup>[163]</sup> which is shown when right-clicking it.

## 5.19 Main Menu Structure

Using the main menu, you can access all functions of PRTG. Following, the most important menu items are described. Often, you can either **click** on an item directly, or **hover** it to show more items.

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

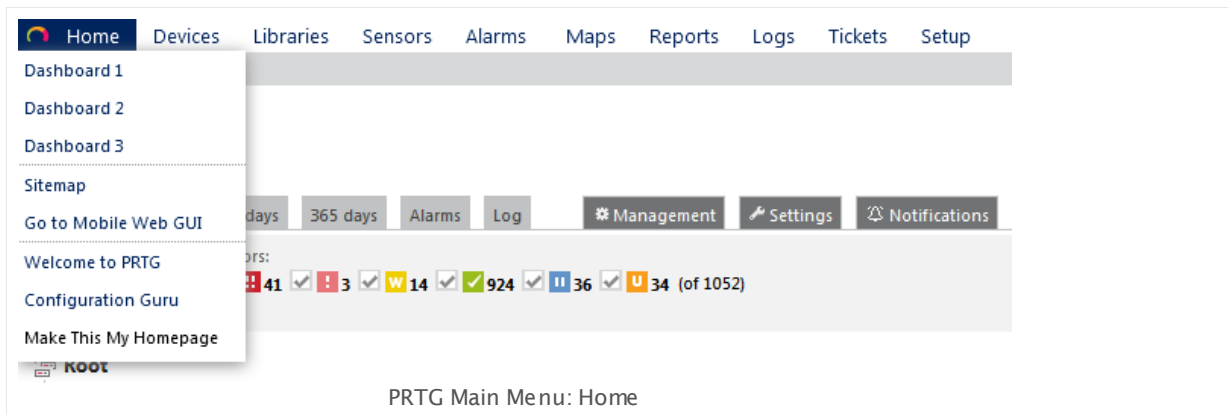

The following menu items are available:

- [Home](#)  175
- [Devices](#)  176
- [Libraries](#)  178
- [Sensors](#)  178
- [Alarms](#)  181
- [Maps](#)  182
- [Reports](#)  182
- [Logs](#)  183
- [Tickets](#)  183
- [Setup](#)  184
- [Refresh \(Arrows Symbol\)](#)  186
- [Help Center \(? Symbol\)](#)  186
- [Logout \(Off Symbol\)](#)  186
- [Search Box](#)  186

---

### Home

**Click** to open the user's homepage. The default setting is PRTG's welcome page. The homepage can be changed in the user's [account settings](#)  1812. **Hover** to show other menu items.

### ▪ Dashboard 1 – Dashboard 3

The dashboards provide different preset overviews with the status of your sensors. Choose the one that fits your needs. **Note:** Dashboards are not customizable. You can create your own overview pages using the [Maps](#) <sup>1794</sup> feature.

### ▪ Switch Cluster Node >

This option is only available if PRTG runs in [Clustering](#) <sup>81</sup> mode. Show available cluster nodes. **Hover** to show other menu items. Follow the menu path (it is specific to your setup) to select another cluster node. The current Master node is shown in bold letters. Click on a node's name and you will leave the current node and connect to the other, showing the same page there.

### ▪ Sitemap

The sitemap contains a flat text view of all menu items. You can easily search for key words using the search function in your browser (usually shortcut **CTRL-F**).

### ▪ Go to Mobile Web GUI

This switches to the [Mobile Web GUI](#) <sup>1947</sup> optimized for low bandwidth and mobile devices. Less scripting is used for more compatibility. However, this is a read-only interface.

### ▪ Welcome to PRTG

Shows the welcome screen which leads you to the major sections of the web interface.

### ▪ Configuration Guru

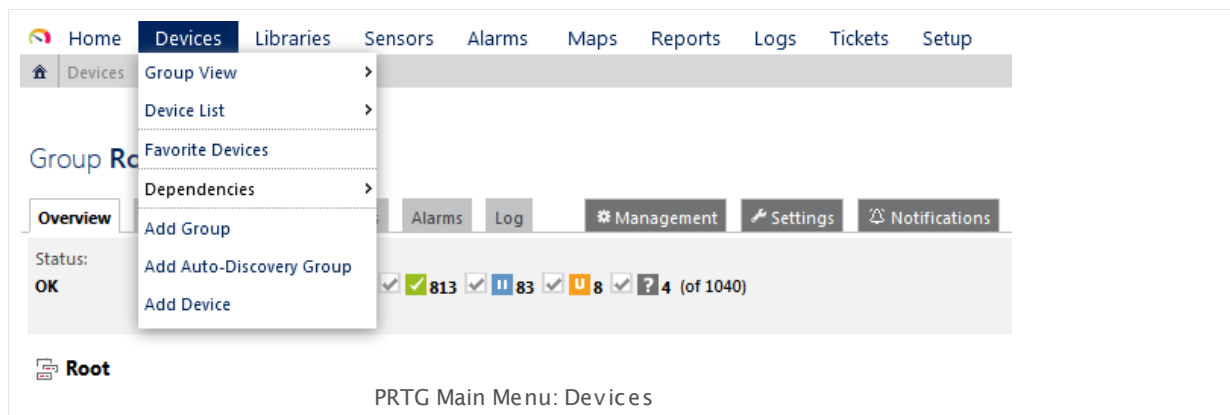

This will open the **Configuration Guru** welcome page. For details about the guru, please see section [Using the Configuration Guru](#) <sup>361</sup>.

### ▪ Make This My Homepage

Change the page that is loaded when you click on the **Home** button in the main menu. Select this menu item on any page and its URL will be set as the current user's homepage immediately. This setting is user sensitive. The default homepage is [/welcome.htm](#). You can change this setting any time by clicking on this menu item again, or by changing the **Homepage URL** in the [My Account](#) <sup>1812</sup> settings.

## Devices

**Click** to show a group view of all your devices, starting with the **Root** group which contains all other groups of your setup. **Hover** to show other menu items.

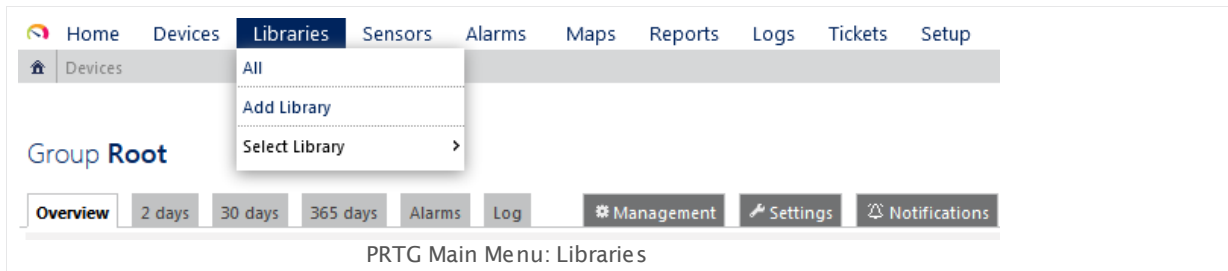

- **Group View** ›  
Shows a tree view of all probes and groups in your setup. **Click** to show a group view of all your devices, starting with the **Root** group which contains all other groups of your setup. **Hover** to show other menu items. Follow the menu path (it is specific to your setup) to view the devices in a specific probe or group only.
- **Device List** ›  
Shows a list view of all devices in your setup. **Click** to show a table list of all devices in your setup. **Hover** to show other menu items. Choose **Favorite Devices** to show a list of all devices marked as **Favorite**<sup>[160]</sup>. **Note:** Follow the menu path (it is specific to your setup) to view a table list of the devices in a specific probe or group only. In the **table list**<sup>[156]</sup> appearing, you can re-sort the items by clicking on the column's header items.
- **Favorite Devices**  
Shows a table list of all devices marked as **Favorite**<sup>[160]</sup>. **Note:** To mark any device as a favorite device, select **Priority/Favorite | Add to Favorites** from its context menu or click on the small flag on a device's details page.
- **Dependencies** ›  
Shows an overview list of the dependencies configured for the objects in your setup. **Hover** the menu item to show other menu items. Choose between **Selected Dependencies** and **Master Dependencies** to view a list of all dependencies or explicit ones. Follow the menu path (it is specific to your setup) to view dependencies of the objects in a specific probe or group only.
- **Add Group**  
Start an assistant which guides you through the process of adding a new group to your setup. For more information, please see section **Create Objects Manually**<sup>[204]</sup>. **Tip:** You can create new groups much faster by choosing **Add Group...** from a probe's or group's context menu!
- **Add Auto-Discovery Group**  
Start an assistant which guides you through the process of adding a new auto-discovery group to your setup. PRTG will create a new group and run an auto-discovery in your network in order to add devices and sensors for these devices automatically. For more information, please see section **Using the Auto-Discovery**<sup>[190]</sup>. **Tip:** You can create new groups much faster by choosing **Add Auto-Discovery Group...** from a probe's or group's context menu!

### ▪ Add Device

Start an assistant which guides you through the process of adding a new device to an existing group. During the process, you can choose if PRTG should run an auto-discover for the new device in order to add sensors automatically. For more information, please see section [Create Objects Manually](#)<sup>[204]</sup>. **Tip:** You can create new devices much faster by choosing **Add Device...** from a group's context menu!

## Libraries

**Click** to call the Libraries feature where you can view or add custom views of your network's status and monitoring data. For more information, please see [Libraries](#)<sup>[1759]</sup> section. **Hover** to show other menu items.

### ▪ All

Calls the Libraries feature where you can view or add custom device tree views of your network's status and monitoring data.

### ▪ Add Library

Lets you directly [add](#)<sup>[1762]</sup> a new library.

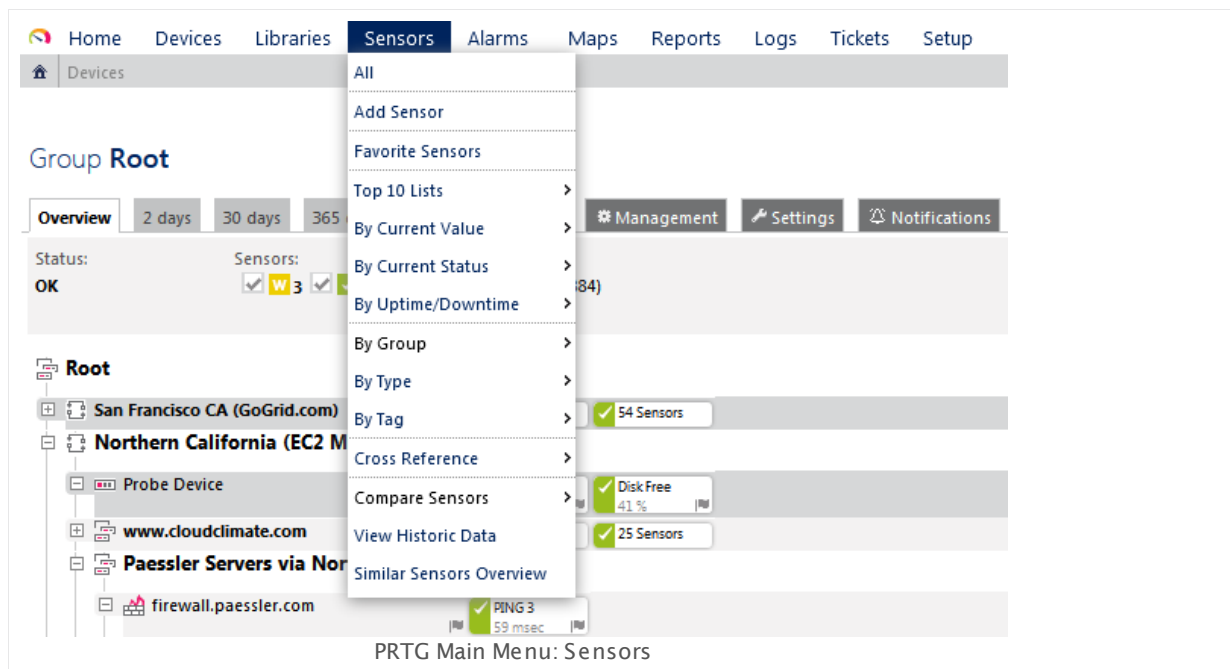

### ▪ Select Library ›

Show existing libraries. **Hover** to show other menu items. Follow the menu path (it is specific to your setup) to select a library.

## Sensors

**Click** to show a table list of all sensors. In the [table list](#)<sup>[156]</sup> appearing, you can re-sort the items by clicking on the column's header items, as well as you can filter the list by related object and tag with the inline filter directly above the table.

**Hover Sensors** in the main menu bar to show other menu items. **Note:** In the column **Last Value** only the last value of the sensor's **primary channel** will be shown.

- **All**  
Shows a table list of all sensors. In the table list appearing, you can re-sort the items by clicking on the column's header items. **Note:** In the column **Last Value** only the last value of the sensor's **primary channel** will be shown.
- **Add Sensor**  
Start an assistant which guides you through the process of adding a new sensor to an existing device. For more information, please see section [Add a Sensor](#)<sup>[220]</sup>. During the process, you can also choose to create a new device. This will bring you to the "Add Device" assistant you can call from the "Devices" menu directly.
- **Favorite Sensors**  
Shows a table list of all sensors marked as [Favorite](#)<sup>[160]</sup>. **Note:** To mark any sensor as a favorite sensor, select **Priority/Favorite | Add to Favorites** from its context menu or click on the small flag on a device's details page.
- **Top 10 Lists >**  
This is an option to show a dashboard view with different Top 10 lists regarding best/worst uptime, Ping, bandwidth usage, website response times, memory usage, and system uptime. **Click** to show Top 10 lists out of all sensors. **Hover** to show other menu items. Follow the menu path (it is specific to your setup) to view Top 10 lists out of a specific probe or group only. **Note:** The sensors will be selected by default tags.
- **By Current Value >**  
This is an option to show a filtered sensor list. **Hover** to show other menu items. Follow the menu path to view [table lists](#)<sup>[156]</sup> of **Fastest** or **Slowest** sensors regarding
  - **Ping**
  - **Port**
  - **Webpages**
  - **IMAP/POP3/SMTP**
  - **FTP**

as well as **Most Used** or **Least Used** sensors regarding

- **Bandwidth**
- **CPU**
- **Disk**
- **Memory**

**Note:** The sensors will be selected by default tags.

- **By Current Status ›**

This is an option to show a filtered sensor list. **Hover** to show other menu items. Follow the menu path to view [table lists](#)<sup>[169]</sup> of all sensors in a certain state. Select between status

- **Up**
- **Warning**
- **Down**
- **Down (Partial)**
- **Down (Acknowledged)**
- **Unusual**
- **Paused**
- **Unknown**

For more information about sensor states, please see [Sensor States](#)<sup>[121]</sup> section.

- **By Uptime/Downtime ›**

This is an option to show a filtered sensor list. **Hover** to show other menu items. Follow the menu path to view [table lists](#)<sup>[156]</sup> of all sensors sorted by their up- or downtime. Select between

- **Best Uptime (%)**
- **Highest Uptime (Time)**
- **Worst Downtime (%)**
- **Highest Downtime (Time)**

- **By Group ›**

This is an option to show a filtered sensor list. **Hover** to show other menu items. Follow the menu path (it is specific to your setup) to view a sensor [table list](#)<sup>[156]</sup> of a specific probe or group only.

- **By Type ›**

This is an option to show a filtered sensor list. **Hover** to show other menu items. Follow the alphabetical menu path (it is specific to your setup) to view a sensor [table list](#)<sup>[156]</sup> containing only sensors of one specific sensor type.

- **By Tag ›**

This is an option to show a filtered sensor list. **Hover** to show other menu items. Follow the alphabetical menu path (it is specific to your setup) to see available tags. Select a tag view a [table list](#)<sup>[156]</sup> containing only sensors marked with this tag.

- **Cross Reference** ›

The cross reference shows information about all sensors including the set interval, access rights, notification trigger settings, schedule, and dependency. **Click** to show a sensor cross reference for all sensors. **Hover** to show other menu items. Follow the menu path (it is specific to your setup) to view cross reference information for sensors in a specific probe or group only, or to view them by type or tag.

- **Compare Sensors** ›

Calls a function to compare graphs of two or more monitoring objects. **Hover** to show other menu items. Follow the menu path to open an assistant for comparing several monitoring objects. For more information, please see [Compare Sensors](#)<sup>[130]</sup> section.

- **View Historic Data**

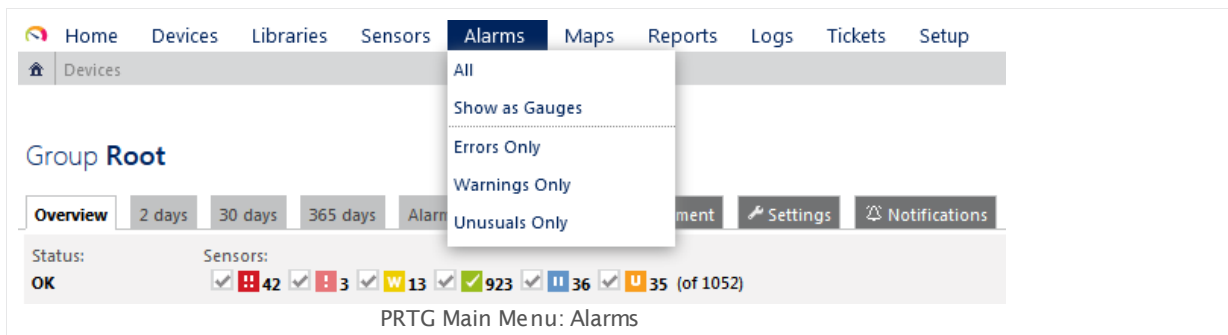

Calls a function for quick generation of sensor data reports. For more information, please see [Historic Data Reports](#)<sup>[133]</sup> section.

- **Similar Sensors Overview**

Calls an overview page listing similar sensors. For more information, please see [Similar Sensors](#)<sup>[138]</sup> section.

## Alarms

**Click** to show a all sensors that currently show a **Down**, **Down (Partial)**, **Warning**, or **Unusual** status. In the [table list](#)<sup>[156]</sup> appearing, you can re-sort the items by clicking on the column's header items. If you select **Show as Gauges**, the sensor gauges will be displayed in a size corresponding to their priority. **Hover** to show other menu items.

- **All**

Shows a list of all sensors which currently show a **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status.

- **Show as Gauges**

Shows the gauges of all sensors which currently show a **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. The size of the sensor gauges corresponds to their respective priority.

- **Errors Only**

Shows a list of all sensors which currently show a **Down**, **Down (Partial)**, or **Down (Acknowledged)** status.

- **Warnings Only**

Shows a list of all sensors which currently show a **Warning** status.

- **Unusuals Only**

Shows a list of all sensors which currently show an **Unusual** status.

## Maps

**Click** to call the Maps feature where you can view or add custom views of your network's status and monitoring data. For more information, please see [Maps](#)<sup>1794</sup> section. **Hover** to show other menu items.

- **All**

Calls the Maps feature where you can view or add custom views of your network's status and monitoring data.

- **Add Map**

Lets you directly [add](#)<sup>1797</sup> a new map.

- **Select Map ›**

Show existing maps. **Hover** to show other menu items. Follow the menu path (it is specific to your setup) to select a map.

## Reports

**Click** to call the Reports feature where you can view or add reports of your monitoring data. For more information, please see [Reports](#)<sup>1775</sup> section. **Hover** to show other menu items.

- **All**

Calls the Reports feature where you can view or add reports of your monitoring data.

- **Add Report**

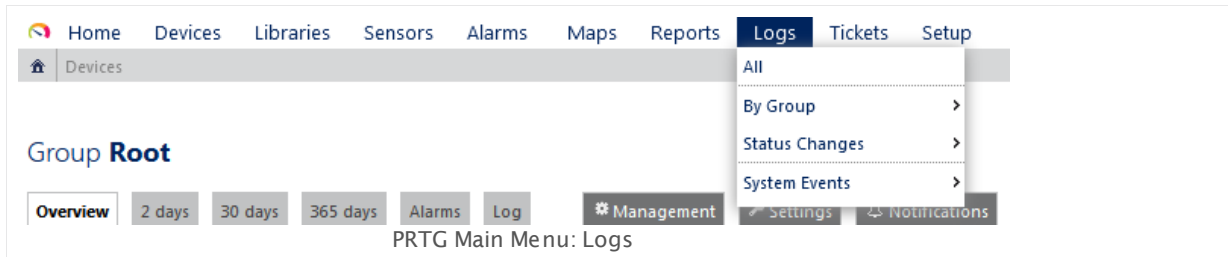

Lets you directly add a new report.

- **Select Report ›**

Show existing reports. **Hover** to show other menu items. Follow the menu path (it is specific to your setup) to select a report.

## Logs

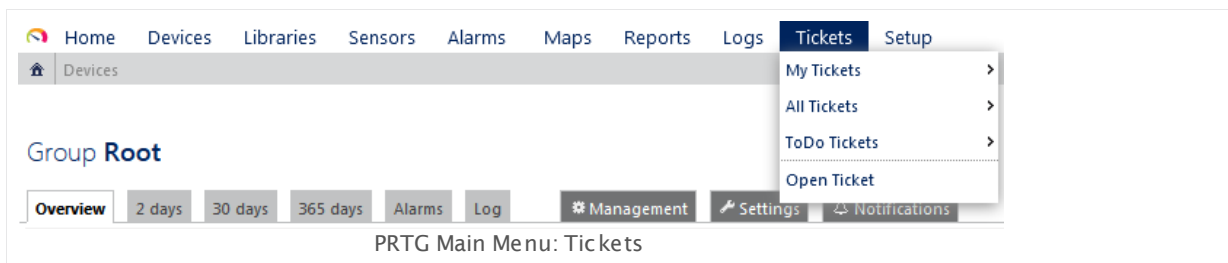

**Click** to show log information for all objects in your configuration, newest first. In the [table list](#) <sup>[156]</sup> appearing, you can filter the items by using the [respective options](#) <sup>[156]</sup>. **Hover** to show other menu items. For more information, please see [Logs](#) <sup>[147]</sup> section.

- **All**  
Show log information for all objects in your configuration, newest first.
- **By Group** ›  
Show log information for objects in a certain group only, newest first. **Hover** to show other menu items. Select **All**, or follow the menu path (it is specific to your setup) to select a group you would like to show log information for.
- **Status Changes** ›  
Show log information for certain status changes only. **Hover** to show other menu items. Follow the menu path to view log entries with a special value in the **Status** field only. Select between **Up & Down** (shows entries with either **Up** or **Down** in the **Status** field), **Down**, **Warning**, **Unusual**, **Up**, **Paused/Resumed** (shows entries with either **Paused** or **Resumed** in the **Status** field), or **Acknowledged Alarms**.
- **System Events** ›  
Show log information regarding certain system event types only. **Hover** to show other menu items. Select between the following event types: **Probe Related**, **Cluster Related**, **Auto-Discovery**, **Notifications**, or **Status Messages**.
- **Object History**  
Shows information about changes to the PRTG setup and lists deletions of subordinate system objects. The object history page has a tab-like interface. Using the tabs you can navigate through various sub-pages in order to view the changes to all related settings and deletions of objects. Select between the following tabs: **My Account**, **System Setup**, **Notifications**, **Schedules**, **User Accounts**, **User Groups**, **Reports**, **Libraries**, or **Maps**.  
**Note:** You can open a specific tab directly with the context button **History** in the [page header bar](#) <sup>[113]</sup> on the corresponding pages.

## Tickets

Tickets show important system information or action steps to take for the administrator. For best experience with PRTG, check every ticket and conduct appropriate actions. **Click** to show all tickets which are assigned to the current user. In the [table list](#) <sup>[156]</sup> appearing, you can re-sort the items by clicking on the column's header items, as well as you can filter the list with the inline filter directly above the table. **Hover** to show other menu items. For more information, please see section [Tickets](#) <sup>[149]</sup>.

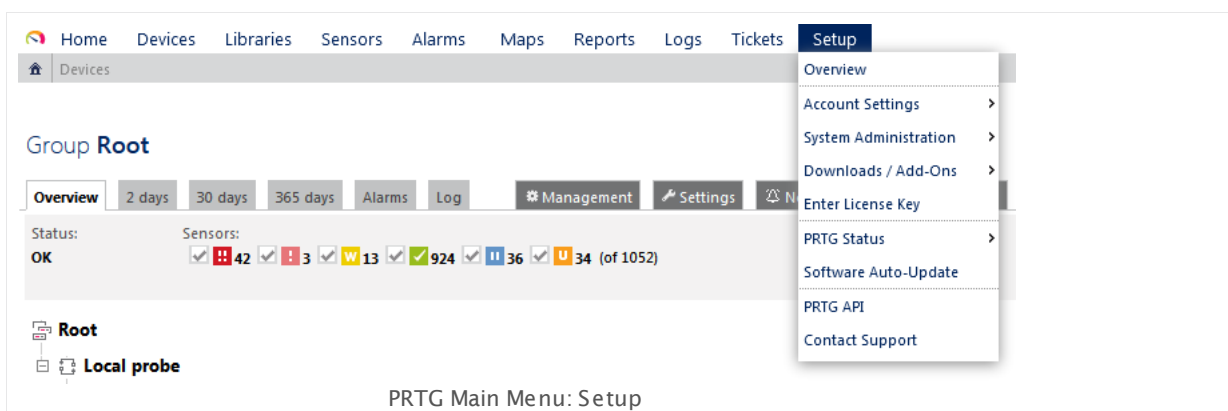

You have several options to display a list of tickets which is filtered to your needs. You can also create a new ticket via the main menu. Available options are:

- **My Tickets**  
Click to show all open tickets which are assigned to the current user. Hover to show other menu items for filtering these tickets depending on their status.
- **All Tickets**  
Click to show all open tickets of all PRTG users. Hover to show other menu items for filtering these tickets depending on their status.
- **ToDo Tickets**  
Click to show all open tickets from the type **ToDo**. Hover to show other menu items for filtering these tickets depending on their status.
- **Open Ticket**  
This will open the **New Ticket** dialog. Provide the needed information and confirm by clicking on **Save** to create a **User Ticket**.

For more information about available options, please refer to section [Tickets](#)<sup>149</sup>.

## Setup

Click to show the setup page. Hover to show other menu items. For more information, please see [Setup](#)<sup>1810</sup> section.

- **Overview**  
Shows the [setup page](#)<sup>1810</sup>.
- **Account Settings** ›  
Hover to show menu items of the account settings. Choose from:

- [My Account](#)  1812
- [Notifications](#)  1817
- [Schedules](#)  1827
- **System Administration** >
 

Hover to show menu items of the system administration settings. Choose from:

  - [User Interface](#)  1831
  - [Monitoring](#)  1839
  - [Notification Delivery](#)  1843
  - [Probes](#)  1849
  - [Cluster](#)  1855
  - [User Accounts](#)  1856
  - [User Groups](#)  1861
  - [Administrative Tools](#)  1865
- **Downloads / Add-Ons** >
 

Shows additional downloads for PRTG. Choose from:

  - [PRTG Enterprise Console](#)  1885
  - [Apps for iOS & Android](#)  1885
  - [Remote Probe Installer](#)  1885
  - [PRTG Add-Ons](#)  1885
  - [PRTG Billing Tool](#)  1886
  - [Chrome Desktop Notifications](#)  1887
- **Enter License Key**

Shows help on how to [Enter a License Key](#)  571.
- **PRTG Status** >
 

Hover to show menu items of the PRTG status. Choose from:

  - [System Status](#)  1869
  - [Cluster Status](#)  1883
  - [Activation Status](#)  1884
- **Software Auto-Update**

Shows the [Software Auto-Update](#)  1878 status of your PRTG installation. On this page, you can also download and install available updates.
- **PRTG API**

Shows documentation about the [Application Programming Interface \(API\) Definition](#)  2031 for your installation.
- **Contact Support**

Calls the [Contact Paessler Support / Send Your Feedback to Paessler](#)  1889 page.

## Refresh (Arrows Symbol)

Click this symbol to refresh all elements on the current page to display current data. Unlike the reload function of your browser, this merely refreshes the single page elements, not the whole page. During the refresh process, this symbol flashes.

## Help Center (? Symbol)

Shows the help center which supports you if you have any questions regarding your PRTG setup.

## Logout (Off Symbol)

Logs out the current user and shows the [login screen](#)<sup>[102]</sup>.

## Search Box

Use the search box to find objects and reports, and other items by name or tag, or to search for help.

## Context Menu

Additionally, there are [Context Menus](#)<sup>[163]</sup> available for all objects. Right-click on an object to open it.

# Part 6

## Ajax Web Interface—Device and Sensor Setup

## 6 Ajax Web Interface—Device and Sensor Setup

The Ajax-based web interface is your access to PRTG. It is used to configure devices and sensors, and to set up notifications, as well as to review monitoring results and to create reports. This web interface is highly interactive, uses Asynchronous Java Script and XML (AJAX) to deliver a powerful and easy-to-use user experience. While the user is [logged in](#)<sup>102</sup>, the data on the screen is permanently refreshed (via Ajax calls) so it always shows the current monitoring results (refresh interval and method can be [set](#)<sup>188</sup> by the user).

Because the web interface works as a **Single Page Application (SPA)**, you will rarely see a full page refresh to avoid this performance impact due to redundant processing. Only single page elements will be refreshed when necessary. All object setting dialogs are shown as pop-up layers, so you will never lose the current context. This speeds up the user experience appreciably and makes the configuration of objects in PRTG comprehensible.

The following sections introduce device and sensor setup in the Ajax Graphical User Interface (GUI).

## 6.1 Auto-Discovery

PRTG's auto-discovery function is a great way to automatically create a sophisticated and concise set of sensors for your complete network. It is mainly suitable for LAN discovery since it involves a lot of SNMP and WMI. For video instructions, please see the [More](#)<sup>[203]</sup> section below.

For a quick start auto-discovery, please see [TWO—Using the Configuration Guru](#)<sup>[36]</sup> section.

### How Auto-Discovery Works

PRTG's auto-discovery process has three stages:

- **Step 1**  
Scanning a network segment for devices using Ping (for groups only).
- **Step 2**  
Assessing the device type for all devices discovered in Step 1 (using SNMP, WMI, and other protocols).
- **Step 3a**  
Creating sensor sets that match the discovered device types of step 2. This is done based on built-in device templates with recommended sensors for many device types.

#### **Step 3b (optional)**

Creating sensor sets using user created device templates (see [Create Device Template](#)<sup>[174]</sup> section).

The auto-discovery can be used on a group level for a range of IP addresses, or for individual devices which you might have created manually. It can be run just once, on demand via the context menu, or scheduled every hour, day or week. Running the auto-discovery every day or week will automatically create new sensors when new devices are connected to the network. As soon as new devices or sensors are discovered, new [Tickets](#)<sup>[149]</sup> are created (which are mailed to the system administrator by default).

Please be aware of the following restrictions of the auto-discovery:

- PRTG can not discover devices that can not be pinged, since Step 1 uses pings. If, for example, a firewall blocks echo requests, a device behind it cannot be discovered.
- You should supply authentication settings for **Windows Systems**, **Linux (SSH/WBEM) Systems**, **VMware/XEN Servers**, and **SNMP Devices** in order to fully exploit the power of this feature. We recommend defining these in the [Root group settings](#)<sup>[224]</sup>.
- If a device has more than one IP address, it may show up more than once in the discovery results, even though PRTG tries to identify these situations.
- If a device already exists on the same **probe**, the auto-discovery will skip this device and **not** create a duplicate.
- Using frequent auto-discoveries of large network segments can lead to performance issues. We therefore recommend to only schedule regular auto-discoveries where necessary. For detailed information see the [More](#)<sup>[203]</sup> section below.

## Run Auto-Discovery Now

You can run an auto-discovery at any time for a group or a device. To do so, **right-click** on the respective object and from the context menu, select **Run Auto-Discovery**. PRTG will immediately start searching for new objects which can be added to the device tree. If used for a group, PRTG will add devices and sensors, if found. If used for a device, it will add new sensors, if found.

**Note:** The auto-discovery will also re-add devices or sensors you have manually deleted. If you do not want this, please create objects [manually](#)<sup>[204]</sup> only.

## Creating an Auto-Discovery Group

There are several ways to start auto-discovery:

- On the [welcome screen](#)<sup>[108]</sup>, click on the **Perform Network Auto-Discovery** option,
- or select **Devices | Add Auto-Discovery Group** from the main menu.

To start an automatic detection of devices and sensors in your network an assistant will appear, leading you through two steps. For faster setup, you can select **Add Auto-Discovery Group...** in the [context menu](#)<sup>[163]</sup> of a probe or group to which you want to add the new group. This will skip step 1 and lead you directly to step 2.

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

## Part 6: Ajax Web Interface—Device and Sensor Setup | 1 Auto-Discovery

**Add Auto-Discovery Group to Group User Group X home**

Define a group name, the IP range for discovery, and credential settings for Windows, Linux, VMware/XEN, and SNMP, if necessary.

[Help: Auto-Discovery](#)

**GROUP NAME AND TAGS**

Group Name:

Tags:

**GROUP TYPE**

Sensor Management

- ☒ Automatic device identification (standard, recommended)
- ☐ Automatic device identification (detailed, may create many sensors)
- ☐ Automatic sensor creation using specific device template(s)

Discovery Schedule:

IP Selection Method

- ☒ Class C base IP with start/end (IPv4)
- ☐ List of individual IPs and DNS Names (IPv4)
- ☐ IP and Subnet (IPv4)
- ☐ IP with octet range (IPv4)
- ☐ List of individual IPs and DNS Names (IPv6)
- ☐ Use computers from the active directory (maximum 1000 computers)

IPv4 Base:

IPv4 Range Start:

IPv4 Range End:

Name Resolution

- ☒ Use DNS / WMI / SNMP names (recommended)
- ☐ Use IP addresses

Device Rescan

- ☒ Skip auto-discovery for known devices/IPs (recommended)
- ☐ Perform auto-discovery for known devices/IPs

**CREDENTIALS FOR WINDOWS SYSTEMS**

☒ inherit from [User Group X home](#) (Domain or Computer Name: paesslergmbh, Userna...)

**CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS**

☒ inherit from [User Group X home](#) (Username: <empty>, Login: 0, For WBEM Use Por...)

**CREDENTIALS FOR VMWARE/XENSERVER**

Add Auto-Discovery Group Dialog

- **Step 1**  
Please choose a probe or group you want to add the new group to. Click on **Continue**.
- **Step 2**  
Add auto-discovery settings as described below.

## Add Auto-Discovery Group Settings

Group Name and Tags	
Group Name	Enter a meaningful name to identify the group. The name will be shown by default in the devices tree and in all alarms.
Tags	Enter one or more tags; confirm each tag by hitting the space, comma, or enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case sensitive. Tags are automatically <a href="#">inherited</a> <sup>89</sup> .

Group Type	
Sensor Management	<p>Select the method for automatic network discovery. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Automatic device identification (standard, recommended):</b> Detect mainly based on Ping, SNMP, and WMI. This option should work fine for most installations.</li> <li>▪ <b>Automatic device identification (detailed, may create many sensors):</b> Detect in a more detailed way and create more sensors. This option uses all standard device templates for auto-discovery. It is suitable for small network segments and whenever you want to monitor the maximum number of sensors available.</li> <li>▪ <b>Automatic sensor creation using specific device template(s):</b> Manually define the device templates used for auto-discovery. From the list below, select one or more templates.</li> </ul>
Device Template(s)	<p>This option is only visible if using specific device templates (last option) is enabled above. Please choose one or more templates by adding a check mark in front of the respective template name. You can also select and deselect all items by using the check box in the table head. These will be used for auto-discovery on the current device. Choose from:</p> <ul style="list-style-type: none"> <li>▪ ADSL</li> <li>▪ Cisco ASA VPN</li> <li>▪ Cisco Device (Generic)</li> <li>▪ Dell MDI</li> <li>▪ DNS Server</li> <li>▪ Environment Jakarta</li> <li>▪ Environment Poseidon</li> <li>▪ Fritzbox</li> <li>▪ FTP Server</li> <li>▪ Generic Device (PING only)</li> <li>▪ Generic Device (SNMP-enabled)</li> <li>▪ Generic Device (SNMP-enabled, Detailed)</li> <li>▪ HTTP Web Server</li> <li>▪ Hyper V Host Server</li> <li>▪ Linux/UNIX Device (SNMP or SSH enabled)</li> <li>▪ Mail Server (Generic)</li> </ul>

	<ul style="list-style-type: none"> <li>▪ Mail Server (MS Exchange)</li> <li>▪ Microsoft Sharepoint 2010</li> <li>▪ NAS LenovoEMC</li> <li>▪ NAS QNAP</li> <li>▪ NAS Synology</li> <li>▪ NetApp</li> <li>▪ NTP Server</li> <li>▪ Printer (HP)</li> <li>▪ RDP Server</li> <li>▪ RMON compatible device</li> <li>▪ Server (Compaq/HP agents)</li> <li>▪ Server (Dell)</li> <li>▪ Server Cisco UCS</li> <li>▪ Server IBM</li> <li>▪ SonicWALL</li> <li>▪ Switch (Cisco Catalyst)</li> <li>▪ Switch (Cisco IOS Based)</li> <li>▪ Switch (HP Procurve)</li> <li>▪ UNIX/Linux Device</li> <li>▪ UPS (APC)</li> <li>▪ Virtuozzo Server</li> <li>▪ VMware ESX / vCenter Server</li> <li>▪ Windows (Detailed via WMI)</li> <li>▪ Windows (via Remote Powershell)</li> <li>▪ Windows (via WMI)</li> <li>▪ Windows IIS (via SNMP)</li> <li>▪ XEN Hosts</li> <li>▪ XEN Virtual Machines</li> </ul> <p>Once the auto-discovery is finished, PRTG will create a new <a href="#">ticket</a> <sup>149</sup> and list the device templates which were actually used to create new sensors. Templates which were not applied will not be shown in the ticket.</p>
Discovery Schedule	Define when the auto-discovery will be run. Choose between:

	<ul style="list-style-type: none"> <li>▪ <b>Once:</b> Perform auto-discovery only once. New devices and sensors will be added once. You can run auto-discovery manually any time using an object's <a href="#">context menu</a><sup>163</sup>.</li> <li>▪ <b>Hourly:</b> Perform auto-discovery for new devices and sensors every 60 minutes. <b>Note:</b> Please use this option with caution! Frequently executed auto-discoveries might cause performance issues, especially when large network segments are scanned every hour.</li> <li>▪ <b>Daily:</b> Perform auto-discovery for new devices and sensors every 24 hours. The first auto-discovery will run immediately, all other discoveries will start on the time defined in the <b>Auto-Discovery Settings</b> section of the <a href="#">System Administration—Monitoring</a><sup>1841</sup> settings.</li> <li>▪ <b>Weekly:</b> Perform auto-discovery for new devices and sensors every 7 days. The first auto-discovery will run immediately, all other discoveries will start on the time defined in the <b>Auto-Discovery Settings</b> section of the <a href="#">System Administration—Monitoring</a><sup>1841</sup> settings.</li> </ul>
IP Selection Method	<p>Define how you want to define the IP range for auto-discovery. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Class C base IP with start/end (IPv4):</b> Define an IPv4 class C address range.</li> <li>▪ <b>List of individual IPs and DNS names (IPv4):</b> Enter a list of individual IPv4 addresses or DNS names.</li> <li>▪ <b>IP and Subnet (IPv4):</b> Enter an IPv4 address and subnet mask.</li> <li>▪ <b>IP with octet range (IPv4):</b> Enter an IPv4 address range for every IP octet individually. With this, you can define very customizable IP ranges.</li> <li>▪ <b>List of individual IPs and DNS names (IPv6):</b> Enter a list of individual IPv6 addresses or DNS names.</li> <li>▪ <b>Use computers from the active directory (maximum 1000 computers):</b> Search in the active directory for computers to perform auto-discovery.</li> </ul> <p><b>Note:</b> Only subnets with up to 65,536 IP addresses can be discovered! If you define a range with a higher number of addresses, discovery will stop before it is completed.</p>
IPv4 Base	<p>This field is only visible if Class C network detection is selected above. Enter a class C network as IP base for the auto-discovery. Enter the first three octets of an IPv4 IP address, for example, <b>192.168.0</b></p>

IPv4 Range Start	This field is only visible if Class C network detection is selected above. Enter the IP octet of the class C network specified above from which PRTG will start the auto-discovery. This will complete the IP base above to an IPv4 address. For example, enter <b>1</b> to discover from <b>192.168.0.1</b> .
IPv4 Range End	This field is only visible if Class C network detection is selected above. Enter the IP octet of the class C network specified above at which PRTG will stop the auto-discovery. This will complete the IP base above to an IPv4 address. For example, enter <b>254</b> to discover up to <b>192.168.0.254</b> .
IPv4/DNS Name List IPv6/DNS Name List	This field is only visible if the IP list option is selected above. Enter a list of IP addresses or DNS names which the auto-discovery will scan. Enter each address in a separate line.
IPv4 and Subnet (IPv4)	This field is only visible if the IP and subnet option is selected above. Enter an expression in the format <b>address/subnet</b> , e.g. <b>192.168.3.0/255.255.255.0</b> . You can also use the short form like <b>192.168.3.0/24</b> in this example. PRTG will scan the complete host range (without network and broadcast address) defined by the IP address and the subnet mask.
IP with Octet Range	This field is only visible if the octet range option is selected above. Enter an expression in the format <b>a1.a2.a3.a4</b> , where <b>a1</b> , <b>a2</b> , <b>a3</b> , and <b>a4</b> are each a number between 0-255, or a range with two numbers and a hyphen like <b>1-127</b> . All permutations of all ranges are calculated, e.g. <b>10.0.1-10.1-100</b> results in 1,000 addresses that PRTG will scan during auto-discovery.
Organizational Unit	<p>This field is only visible if active directory is selected above. Enter an organizational unit (OU) to restrict the active directory search to computers which are part of this OU. Just enter the name of the OU without any other term (i.e., without "OU" in front). If you leave this field empty, there will not be any restriction.</p> <p>If you have sub-OUs, too, please consider the correct syntax in the format <b>Y,OU=X</b>: OUs that are part of another OU have to be listed together with their parent(s). Enter the sub-OU followed by <b>,OU=</b> and the name of the parent OU. For example, assuming that the organizational unit 'Y' is part of the OU named 'X'. Then the syntax would be <b>Y,OU=X</b>. For three OUs 'X', 'Y' part of 'X', and 'Z' part of 'Y', the syntax would be <b>Z,OU=Y,OU=X</b>. Note that the order is important, sub-OUs have to be listed left of its according parents!</p>
Name Resolution	<p>Define how newly discovered devices will be monitored. This only affects <b>new</b> devices. The setting for existing devices will be kept. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use DNS / WMI / SNMP names (recommended)</b>: Monitor newly discovered devices via their DNS, WMI, or SNMP names (if available).</li> </ul>

	<ul style="list-style-type: none"> <li>▪ <b>Use IP addresses:</b> Monitor newly discovered devices via their IP address.</li> </ul> <p>We recommend using the default value.</p>
Device Rescan	<p>Define if you want to rescan known devices. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Skip auto-discovery for known devices/IPs (recommended):</b> Do not re-scan known devices or IP addresses, but only scan for new devices/IPs when auto-discovering. This can avoid re-creation of manually deleted sensors. PRTG will also avoid adding devices that are already included elsewhere in your configuration, e.g. in other groups.</li> <li>▪ <b>Perform auto-discovery for known devices/IPs:</b> Re-scan known devices and IP addresses with every auto-discovery. This will re-create manually deleted sensors on existing devices.</li> </ul> <p>We recommend using the default value.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

If you have not set credentials yet, set them now before starting the auto-discovery in order to fully exploit the power of this feature!

Credentials for Windows Systems	
Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, please enter the computer name here. If you want to use a Windows domain user account (recommended), please enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Please do <b>not</b> leave this field empty.
Username	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems	
Username	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	<p>Define which authentication method will be used for login. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Login via Password:</b> Provide a password for login. Enter below.</li> <li>▪ <b>Login via Private Key:</b> Provide a private key for authentication. <b>Note:</b> PRTG can only handle keys in OpenSSH format which are <b>not</b> encrypted. You cannot use password protected keys here. In the text field, please paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, please see <a href="#">Monitoring via SSH</a><sup>1962</sup>.</li> </ul>
Password	This field is only visible if password login is selected above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	This field is only visible if private key login is selected above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges. <b>Note:</b> If you do not insert a private key for the first time, but <b>change</b> the private key, you need to restart your PRTG core server service in order for the private key change to take effect! For details, please see <a href="#">Monitoring via SSH</a> <sup>1962</sup> .
For WBEM Use Protocol	<p>Define the protocol that will be used for WBEM. This setting is only relevant when using WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>HTTP:</b> Use an unencrypted connection for WBEM.</li> <li>▪ <b>HTTPS:</b> Use an SSL-encrypted connection for WBEM.</li> </ul>
For WBEM Use Port	<p>Define the port that will be used for WBEM. This setting is only relevant when using WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Set automatically (port 5988 or 5989):</b> Use one of the standard ports, depending on whether unencrypted or encrypted connection is chosen above.</li> <li>▪ <b>Set manually:</b> Use a custom port. Define below.</li> </ul>
WBEM Port	This setting is only visible if manual port selection is enabled above. Enter the WBEM port number.
SSH Port	<p>Define the port number which will be used for SSH connections. <b>Note:</b> By default, this setting is automatically used for all <a href="#">SSH sensors</a><sup>296</sup>, unless you define a different port number in the sensor settings.</p>

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems	
SSH Rights Elevation	<p>Define with which rights the command will be executed on the target system. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Run the command as the user connecting (default):</b> Use the rights of the user who establishes the SSH connection.</li> <li>▪ <b>Run the command as another user using 'sudo':</b> Use the rights of another user, for example, the administrator.</li> <li>▪ <b>Run the command as another user using 'su':</b> Use the rights of another target user.</li> </ul>
Target Username	<p>This field is only visible if <b>sudo</b> or <b>su</b> is enabled above. Enter a username to run the specified command as another user than root. If you leave this field empty, the command will be run as root. Ensure that you set the Linux password even you use a public/private key for authentication. This is not necessary if the user is allowed to execute the command without a password.</p>
Password Target User	<p>This field is only visible if <b>su</b> is enabled above. Enter the password for the specified target user.</p>

Credentials for VMware/XenServer	
User	Enter a login name for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
VMware Protocol	<p>Define the protocol used for the connection to VMware and XenServer. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>HTTPS (recommended):</b> Use an SSL-encrypted connection to VMware and XenServers.</li> <li>▪ <b>HTTP:</b> Use an unencrypted connection to VMware and XenServers.</li> </ul>

Credentials for SNMP Devices	
SNMP Version	<p>Select the SNMP version that will be used for device connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>v1:</b> Use the simple standard v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.</li> </ul>

Credentials for SNMP Devices	
	<ul style="list-style-type: none"> <li>▪ <b>v2c</b>: Use the more advanced v2c protocol for SNMP connections. Data is still transferred as clear-text, but it supports 64-bit counters.</li> <li>▪ <b>v3</b>: Use the latest v3 protocol for SNMP connections. It provides secure authentication and data encryption.</li> </ul> <p><b>Note for SNMP v3:</b> Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" reading of the probe health sensor, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.</p>
Community String	This setting is only visible if SNMP version v1 or v2c are enabled above. Enter the community string of your devices. This is a kind of "clear-text password" used for simple authentication. We recommend using the default value.
Authentication Type	<p>This setting is only visible if SNMP version v3 is enabled above. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>MD5</b>: Use <b>Message-Digest Algorithm 5</b> (MD5) for authentication.</li> <li>▪ <b>SHA</b>: Use <b>Secure Hash Algorithm</b> (SHA) for authentication.</li> </ul> <p>The chosen type has to match the authentication type of your device.</p> <p><b>Note:</b> If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field <b>password</b> empty. In this case, <b>SNMP_SEC_LEVEL_NOAUTH</b> will be used and authentication will be deactivated entirely.</p>
User	This setting is only visible if SNMP version v3 is enabled above. Enter a username for secure authentication. This value has to match the username of your device.
Password	This setting is only visible if SNMP version v3 is enabled above. Enter a password for secure authentication. This value has to match the password of your device.
Encryption Type	<p>This setting is only visible if SNMP version v3 is enabled above. Select an encryption type. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>DES</b>: Use <b>Data Encryption Standard</b> (DES) as encryption algorithm.</li> </ul>

Credentials for SNMP Devices	
	<ul style="list-style-type: none"><li>▪ <b>AES:</b> Use <b>Advanced Encryption Standard</b> (AES) as encryption algorithm.</li></ul> <p>The chosen type has to match the encryption type of your device.</p>
Data Encryption Key	<p>This setting is only visible if SNMP version v3 is enabled above. Enter an encryption key here. If you provide a key in this field, SNMP data packets will be encrypted using the encryption algorithm selected above, providing increased security. The provided key here has to match the encryption key of your device.</p> <p><b>Note:</b> If the key entered in this field does not match the key configured in the target SNMP device, you will not get an error message! Please enter a string or leave the field empty.</p>
Context Name	<p>This setting is only visible if SNMP version v3 is enabled above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.</p>
SNMP Port	<p>Enter the port used for SNMP communication. We recommend using the default value.</p>
SNMP Timeout (sec.)	<p>Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered.</p>

Proxy Settings for HTTP Sensors	
HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. <b>Note:</b> This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see <a href="#">System Administration—Core &amp; Probes</a> <small>1849</small> .
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its settings.</li> <li>▪ <b>Write:</b> Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, as well as review and edit its settings and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> <small>1861</small> settings.</p>

Click on the **Continue** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

## Auto-Discovery in Progress

While auto-discovery is running you may experience a lower system performance as usual, because PRTG works in the background in order to discover your network. Depending on the IP ranges defined (up to 65,536 addresses), the discovery may run up to several days before complete. You can review the status of the discovery process as follows:

- In the device tree, behind the group or device name, you will see a percentage value showing the progress of auto-discovery.
- During auto-discovery, the web interface will display a box in the lower right corner, showing the number of active auto-discovery tasks.
- In order to stop a running auto-discovery, right-click the group or device, and select **Pause | For 5 minutes...** from the [context menu](#)<sup>163</sup>. Monitoring will be paused for 5 minutes, and auto-discovery tasks will be shut down.

## 6.2 Create Objects Manually

We recommend using the [auto-discovery](#)<sup>[190]</sup> function to create a basic monitoring setup for your network. Afterwards, you can manually create devices that could not be discovered, or [arrange](#)<sup>[173]</sup> detected devices in groups.

The procedure depends on the kind of object you want to add. Choose between:

- [Add a Group](#)<sup>[205]</sup>
- [Add a Device](#)<sup>[211]</sup>
- [Add a Sensor](#)<sup>[220]</sup>

### Add a Remote Probe

Please see [Multiple Probes and Remote Probes](#)<sup>[204]</sup> section for more information.

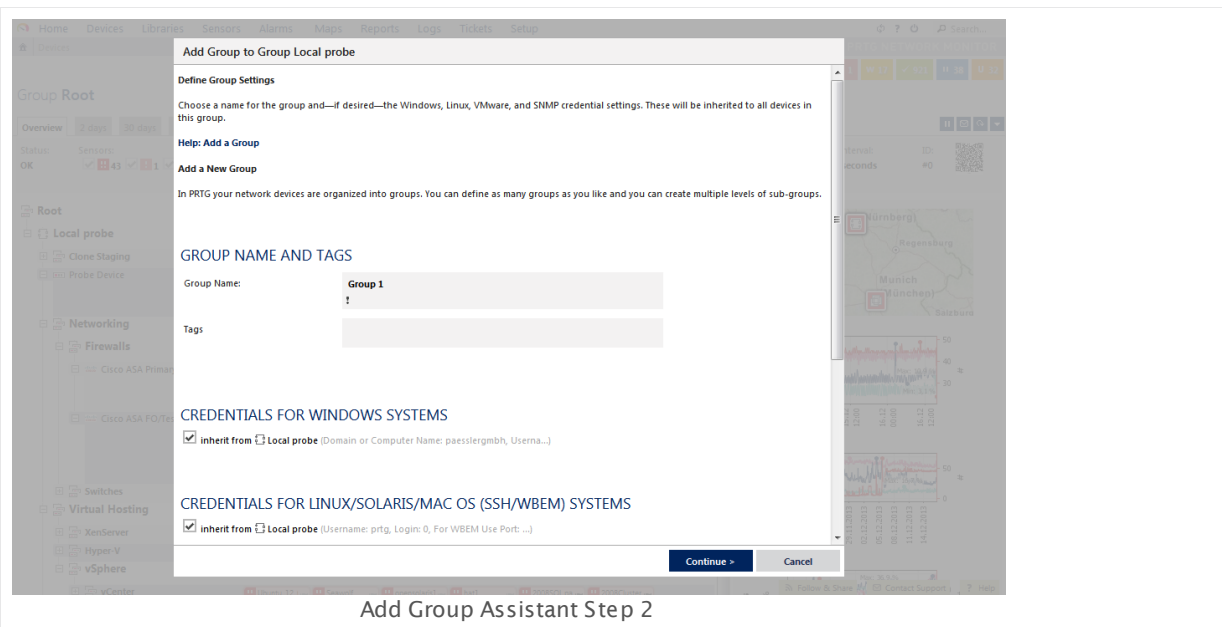

## 6.2.1 Add a Group

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

In order to add a group manually, select **Devices | Add Group** from the main menu. An assistant will appear, leading you through two steps. For faster setup, you can select **Add Group...** in the [context menu](#)<sup>163</sup> of a probe or group to which you want to add the new group. This will skip step 1 and lead you directly to step 2.

### ■ Step 1

Please choose a probe or group you want to add the new group to. Click on **Continue**.

### ■ Step 2

Add group settings as described below.

## Add Group Settings

### Group Name and Tags

Group Name	Enter a meaningful name to identify the group. The name will be shown by default in the devices tree and in all alarms.
Tags	Enter one or more tags; confirm each tag by hitting the space, comma, or enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case sensitive. Tags are automatically <a href="#">inherited</a> <sup>164</sup> .

Credentials for Windows Systems	
Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, please enter the computer name here. If you want to use a Windows domain user account (recommended), please enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Please do <b>not</b> leave this field empty.
Username	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems	
Username	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	<p>Define which authentication method will be used for login. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Login via Password:</b> Provide a password for login. Enter below.</li> <li>▪ <b>Login via Private Key:</b> Provide a private key for authentication. <b>Note:</b> PRTG can only handle keys in OpenSSH format which are <b>not</b> encrypted. You cannot use password protected keys here. In the text field, please paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, please see <a href="#">Monitoring via SSH</a>.</li> </ul>
Password	This field is only visible if password login is selected above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	This field is only visible if private key login is selected above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges. <b>Note:</b> If you do not insert a private key for the first time, but <b>change</b> the private key, you need to restart your PRTG core server service in order for the private key change to take effect! For details, please see <a href="#">Monitoring via SSH</a> .
For WBEM Use Protocol	<p>Define the protocol that will be used for WBEM. This setting is only relevant when using WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>HTTP:</b> Use an unencrypted connection for WBEM.</li> </ul>

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems	
	<ul style="list-style-type: none"> <li>▪ <b>HTTPS:</b> Use an SSL-encrypted connection for WBEM.</li> </ul>
For WBEM Use Port	<p>Define the port that will be used for WBEM. This setting is only relevant when using WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Set automatically (port 5988 or 5989):</b> Use one of the standard ports, depending on whether unencrypted or encrypted connection is chosen above.</li> <li>▪ <b>Set manually:</b> Use a custom port. Define below.</li> </ul>
WBEM Port	This setting is only visible if manual port selection is enabled above. Enter the WBEM port number.
SSH Port	<p>Define the port number which will be used for SSH connections.</p> <p><b>Note:</b> By default, this setting is automatically used for all <a href="#">SSH sensors</a> <sup>296</sup>, unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Define with which rights the command will be executed on the target system. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Run the command as the user connecting (default):</b> Use the rights of the user who establishes the SSH connection.</li> <li>▪ <b>Run the command as another user using 'sudo':</b> Use the rights of another user, for example, the administrator.</li> <li>▪ <b>Run the command as another user using 'su':</b> Use the rights of another target user.</li> </ul>
Target Username	<p>This field is only visible if <b>sudo</b> or <b>su</b> is enabled above. Enter a username to run the specified command as another user than root. If you leave this field empty, the command will be run as root. Ensure that you set the Linux password even you use a public/private key for authentication. This is not necessary if the user is allowed to execute the command without a password.</p>
Password Target User	This field is only visible if <b>su</b> is enabled above. Enter the password for the specified target user.
Credentials for VMware/XenServer	
User	Enter a login name for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.

### Credentials for VMware/XenServer

#### VMware Protocol

Define the protocol used for the connection to VMware and XenServer. Choose between:

- **HTTPS (recommended):** Use an SSL-encrypted connection to VMware and XenServers.
- **HTTP:** Use an unencrypted connection to VMware and XenServers.

### Credentials for SNMP Devices

#### SNMP Version

Select the SNMP version that will be used for device connection. Choose between:

- **v1:** Use the simple standard v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.
- **v2c:** Use the more advanced v2c protocol for SNMP connections. Data is still transferred as clear-text, but it supports 64-bit counters.
- **v3:** Use the latest v3 protocol for SNMP connections. It provides secure authentication and data encryption.

**Note for SNMP v3:** Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" reading of the probe health sensor, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.

#### Community String

This setting is only visible if SNMP version v1 or v2c are enabled above. Enter the community string of your devices. This is a kind of "clear-text password" used for simple authentication. We recommend using the default value.

#### Authentication Type

This setting is only visible if SNMP version v3 is enabled above. Choose between:

- **MD5:** Use **Message-Digest Algorithm 5** (MD5) for authentication.
- **SHA:** Use **Secure Hash Algorithm** (SHA) for authentication.

The chosen type has to match the authentication type of your device.

Credentials for SNMP Devices	
	<p><b>Note:</b> If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field <b>password</b> empty. In this case, <b>SNMP_SEC_LEVEL_NOAUTH</b> will be used and authentication will be deactivated entirely.</p>
User	This setting is only visible if SNMP version v3 is enabled above. Enter a username for secure authentication. This value has to match the username of your device.
Password	This setting is only visible if SNMP version v3 is enabled above. Enter a password for secure authentication. This value has to match the password of your device.
Encryption Type	<p>This setting is only visible if SNMP version v3 is enabled above. Select an encryption type. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>DES:</b> Use <b>Data Encryption Standard</b> (DES) as encryption algorithm.</li> <li>▪ <b>AES:</b> Use <b>Advanced Encryption Standard</b> (AES) as encryption algorithm.</li> </ul> <p>The chosen type has to match the encryption type of your device.</p>
Data Encryption Key	<p>This setting is only visible if SNMP version v3 is enabled above. Enter an encryption key here. If you provide a key in this field, SNMP data packets will be encrypted using the encryption algorithm selected above, providing increased security. The provided key here has to match the encryption key of your device.</p> <p><b>Note:</b> If the key entered in this field does not match the key configured in the target SNMP device, you will not get an error message! Please enter a string or leave the field empty.</p>
Context Name	This setting is only visible if SNMP version v3 is enabled above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port used for SNMP communication. We recommend using the default value.
SNMP Timeout (sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered.

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"><li>▪ <b>Inherited:</b> Use the settings of the parent object.</li><li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists.</li><li>▪ <b>Read:</b> Users in this group can see the object and review its settings.</li><li>▪ <b>Write:</b> Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings.</li><li>▪ <b>Full:</b> Users in this group can see the object, as well as review and edit its settings and edit access rights settings.</li></ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings.</p>

Click on the **Continue** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

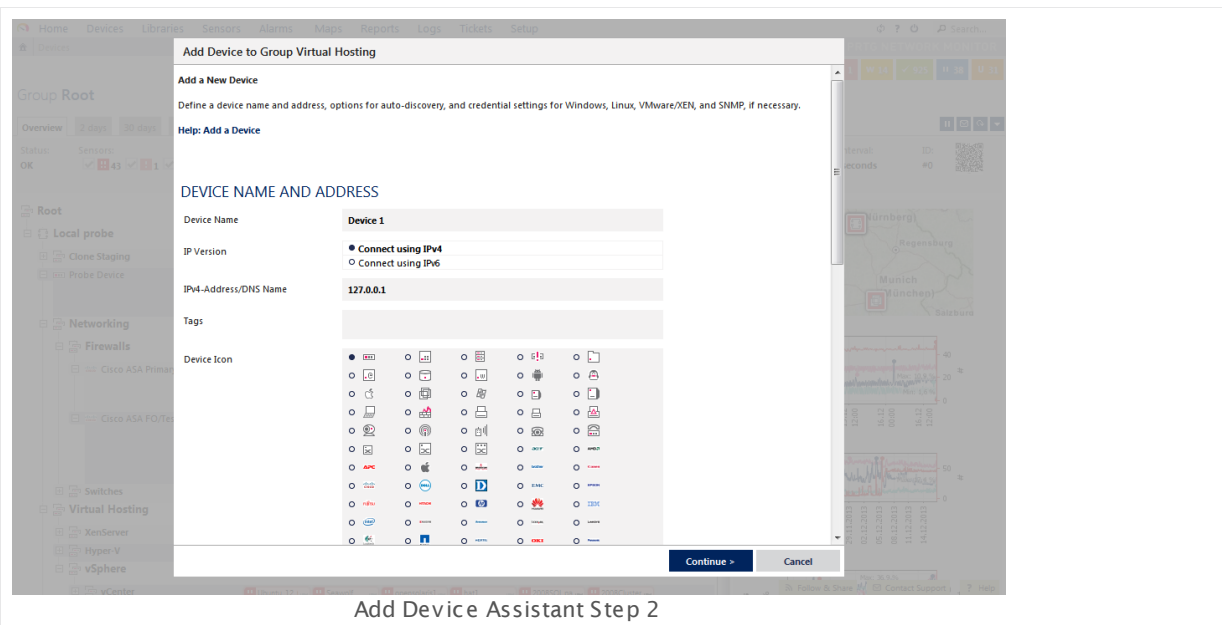

## 6.2.2 Add a Device

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

To manually add a device, select **Devices | Add Device** from the main menu. An assistant will appear, leading you through two steps. For faster setup, you can select **Add Device...** in the [context menu](#)<sup>163</sup> of a group to which you want to add the new device. This will skip step 1 and lead you directly to step 2.

### ■ Step 1

Please choose a group you want to add the new device to. Click on **Continue**.

### ■ Step 2

Add device settings as described below.

## Add Device Settings

Device Name and Address	
Device Name	Enter a meaningful name to identify the device. The name will be shown by default in the device tree and in all alarms.
IP Version	Define which IP protocol PRTG will use to connect to this device. The setting is valid for all sensors created on this device. Choose between: <ul style="list-style-type: none"> <li>■ <b>Connect using IPv4:</b> Use IP version 4 for all requests to this device.</li> </ul>

Device Name and Address	
	<ul style="list-style-type: none"> <li>▪ <b>Connect using IPv6:</b> Use IP version 6 for all requests to this device.</li> </ul>
IP Address/DNS Name	Enter the IP address (either v4 or v6, depending on your selection above) or DNS name for the device. Most sensors created on this device will inherit this setting and they will try to connect to this address for monitoring. <b>Note:</b> There are some sensor types that still have their own setting for IP address/DNS name. Those sensors will use their own settings.
Tags	Enter one or more tags; confirm each tag by hitting space, comma, or enter key. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. Tags are automatically <a href="#">inherited</a> .
Device Icon	Choose a device icon from the list. It will be shown in the device tree.

Device Type	
Sensor Management	<p>Select which type of auto-discovery you would like to perform for this device. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Manual (no auto-discovery):</b> Do not auto-discover any sensors, but only add sensors manually.</li> <li>▪ <b>Automatic device identification (standard, recommended):</b> Use a small set of auto-discovery templates. This will scan your LAN and usually create a view standard sensors on your device.</li> <li>▪ <b>Automatic device identification (detailed, may create many sensors):</b> Use an extended set of auto-discovery templates. This will scan your LAN and usually create many sensors on your device.</li> <li>▪ <b>Automatic sensor creation using specific device templates:</b> Use specific auto-discovery templates only. Please select templates below. This will scan your LAN and add sensors defined in the template.</li> </ul>
Discovery Schedule	<p>This option is only visible if one of the auto-discovery options is selected above. Define when the auto-discovery will be run. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Once:</b> Perform auto-discovery only once. For existing devices, this will initiate a one-time sensor update for the current device.</li> <li>▪ <b>Hourly:</b> Perform auto-discovery for new sensors every hour.</li> <li>▪ <b>Daily:</b> Perform auto-discovery for new sensors every day.</li> </ul>

Device Type	
	<ul style="list-style-type: none"> <li>▪ <b>Weekly</b>: Perform auto-discovery for new sensors every week.</li> </ul>
Device Template(s)	<p>This option is only visible if using specific device templates (last option) is enabled above. Please choose one or more templates by adding a check mark in front of the respective template name. You can also select and deselect all items by using the check box in the table head. These will be used for auto-discovery on the current device. Choose from:</p> <ul style="list-style-type: none"> <li>▪ ADSL</li> <li>▪ Cisco ASA VPN</li> <li>▪ Cisco Device (Generic)</li> <li>▪ Dell MDI</li> <li>▪ DNS Server</li> <li>▪ Environment Jakarta</li> <li>▪ Environment Poseidon</li> <li>▪ Fritzbox</li> <li>▪ FTP Server</li> <li>▪ Generic Device (PING only)</li> <li>▪ Generic Device (SNMP-enabled)</li> <li>▪ Generic Device (SNMP-enabled, Detailed)</li> <li>▪ HTTP Web Server</li> <li>▪ Hyper V Host Server</li> <li>▪ Linux/UNIX Device (SNMP or SSH enabled)</li> <li>▪ Mail Server (Generic)</li> <li>▪ Mail Server (MS Exchange)</li> <li>▪ Microsoft Sharepoint 2010</li> <li>▪ NAS LenovoEMC</li> <li>▪ NAS QNAP</li> <li>▪ NAS Synology</li> <li>▪ NetApp</li> <li>▪ NTP Server</li> <li>▪ Printer (HP)</li> <li>▪ RDP Server</li> <li>▪ RMON compatible device</li> </ul>

Device Type	
	<ul style="list-style-type: none"> <li>▪ Server (Compaq/HP agent s)</li> <li>▪ Server (Dell)</li> <li>▪ Sever Cisco UCS</li> <li>▪ Server IBM</li> <li>▪ SonicWALL</li> <li>▪ Switch (Cisco Catalyst)</li> <li>▪ Switch (Cisco IOS Based)</li> <li>▪ Switch (HP Procurve)</li> <li>▪ UNIX/Linux Device</li> <li>▪ UPS (APC)</li> <li>▪ Virtuozzo Server</li> <li>▪ VMware ESX / vCenter Server</li> <li>▪ Windows (Detailed via WMI)</li> <li>▪ Windows (via Remote Powershell)</li> <li>▪ Windows (via WMI)</li> <li>▪ Windows IIS (via SNMP)</li> <li>▪ XEN Host s</li> <li>▪ XEN Virtual Machines</li> </ul> <p>Once the auto-discovery is finished, PRTG will create a new <a href="#">ticket</a> [149] and list the device templates which were actually used to create new sensors. Templates which were not applied will not be shown in the ticket.</p>

Credentials for Windows Systems	
Domain or Computer Name	<p>Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, please enter the computer name here. If you want to use a Windows domain user account (recommended), please enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Please do <b>not</b> leave this field empty.</p>

Credentials for Windows Systems	
Username	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems	
Username	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	<p>Define which authentication method will be used for login. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Login via Password:</b> Provide a password for login. Enter below.</li> <li>▪ <b>Login via Private Key:</b> Provide a private key for authentication. <b>Note:</b> PRTG can only handle keys in OpenSSH format which are <b>not</b> encrypted. You cannot use password protected keys here. In the text field, please paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, please see <a href="#">Monitoring via SSH</a>.</li> </ul>
Password	This field is only visible if password login is selected above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	This field is only visible if private key login is selected above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges. <b>Note:</b> If you do not insert a private key for the first time, but <b>change</b> the private key, you need to restart your PRTG core server service in order for the private key change to take effect! For details, please see <a href="#">Monitoring via SSH</a> .
For WBEM Use Protocol	<p>Define the protocol that will be used for WBEM. This setting is only relevant when using WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>HTTP:</b> Use an unencrypted connection for WBEM.</li> <li>▪ <b>HTTPS:</b> Use an SSL-encrypted connection for WBEM.</li> </ul>
For WBEM Use Port	<p>Define the port that will be used for WBEM. This setting is only relevant when using WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Set automatically (port 5988 or 5989):</b> Use one of the standard ports, depending on whether unencrypted or encrypted connection is chosen above.</li> </ul>

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems	
	<ul style="list-style-type: none"> <li>▪ <b>Set manually:</b> Use a custom port. Define below.</li> </ul>
WBEM Port	This setting is only visible if manual port selection is enabled above. Enter the WBEM port number.
SSH Port	<p>Define the port number which will be used for SSH connections.</p> <p><b>Note:</b> By default, this setting is automatically used for all <a href="#">SSH sensors</a><sup>[296]</sup>, unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Define with which rights the command will be executed on the target system. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Run the command as the user connecting (default):</b> Use the rights of the user who establishes the SSH connection.</li> <li>▪ <b>Run the command as another user using 'sudo':</b> Use the rights of another user, for example, the administrator.</li> <li>▪ <b>Run the command as another user using 'su':</b> Use the rights of another target user.</li> </ul>
Target Username	<p>This field is only visible if <b>sudo</b> or <b>su</b> is enabled above. Enter a username to run the specified command as another user than root. If you leave this field empty, the command will be run as root. Ensure that you set the Linux password even you use a public/private key for authentication. This is not necessary if the user is allowed to execute the command without a password.</p>
Password Target User	<p>This field is only visible if <b>su</b> is enabled above. Enter the password for the specified target user.</p>

Credentials for VMware/XenServer	
User	Enter a login name for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
VMware Protocol	<p>Define the protocol used for the connection to VMware and XenServer. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>HTTPS (recommended):</b> Use an SSL-encrypted connection to VMware and XenServers.</li> <li>▪ <b>HTTP:</b> Use an unencrypted connection to VMware and XenServers.</li> </ul>

Credentials for SNMP Devices	
SNMP Version	<p>Select the SNMP version that will be used for device connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>v1</b>: Use the simple standard v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.</li> <li>▪ <b>v2c</b>: Use the more advanced v2c protocol for SNMP connections. Data is still transferred as clear-text, but it supports 64-bit counters.</li> <li>▪ <b>v3</b>: Use the latest v3 protocol for SNMP connections. It provides secure authentication and data encryption.</li> </ul> <p><b>Note for SNMP v3:</b> Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" reading of the probe health sensor, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.</p>
Community String	<p>This setting is only visible if SNMP version <b>v1</b> or <b>v2c</b> are enabled above. Enter the community string of your devices. This is a kind of "clear-text password" used for simple authentication. We recommend using the default value.</p>
Authentication Type	<p>This setting is only visible if SNMP version v3 is enabled above. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>MD5</b>: Use <b>Message-Digest Algorithm 5</b> (MD5) for authentication.</li> <li>▪ <b>SHA</b>: Use <b>Secure Hash Algorithm</b> (SHA) for authentication.</li> </ul> <p>The chosen type has to match the authentication type of your device.</p> <p><b>Note:</b> If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field <b>password</b> empty. In this case, <b>SNMP_SEC_LEVEL_NOAUTH</b> will be used and authentication will be deactivated entirely.</p>
User	<p>This setting is only visible if SNMP version v3 is enabled above. Enter a username for secure authentication. This value has to match the username of your device.</p>
Password	<p>This setting is only visible if SNMP version v3 is enabled above. Enter a password for secure authentication. This value has to match the password of your device.</p>

Credentials for SNMP Devices	
Encryption Type	<p>This setting is only visible if SNMP version v3 is enabled above. Select an encryption type. Choose between:</p> <ul style="list-style-type: none"><li>▪ <b>DES:</b> Use <b>Data Encryption Standard</b> (DES) as encryption algorithm.</li><li>▪ <b>AES:</b> Use <b>Advanced Encryption Standard</b> (AES) as encryption algorithm.</li></ul> <p>The chosen type has to match the encryption type of your device.</p>
Data Encryption Key	<p>This setting is only visible if SNMP version v3 is enabled above. Enter an encryption key here. If you provide a key in this field, SNMP data packets will be encrypted using the encryption algorithm selected above, providing increased security. The provided key here has to match the encryption key of your device.</p> <p><b>Note:</b> If the key entered in this field does not match the key configured in the target SNMP device, you will not get an error message! Please enter a string or leave the field empty.</p>
Context Name	<p>This setting is only visible if SNMP version v3 is enabled above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.</p>
SNMP Port	<p>Enter the port used for SNMP communication. We recommend using the default value.</p>
SNMP Timeout (sec.)	<p>Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

Click on the **Continue** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

## 6.2.3 Add a Sensor

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

In order to add a sensor manually, select **Sensors | Add Sensor** from the main menu. An assistant will appear, leading you through two steps. For faster setup, you can select **Add Sensor...** in the [context menu](#)<sup>163</sup> of a device to which you want to add the new sensor. This will skip step 1 and lead you directly to step 2.

### ■ Step 1

Please select **Add sensor to an existing device** and choose a device you want to add the new sensor to. Click on **Continue**.

**Add Sensor Assistant**

- **Step 2**

The **Add Sensor** assistant is shown (see screenshot above). Select a sensor you want to add and enter the needed settings. You can filter the listed sensors by type, by target system, and by the used technology. You can choose one aspect per filter. Alternatively or additionally, you can use the live search by typing in a key term (or a substring) in the **Search** box. PRTG also suggests sensor types to create on the selected device; this recommendation is automatically calculated based on the current user's sensor usage and shows the ten commonest sensor types by default (if enough sensor types are already in use). The chosen filter also applies to the recommendation. See section **More** if you want to adjust the number of most used sensor types which are shown here or to hide this option completely.

For more information about a sensor type, please see the manual section of the respective sensor. See [List of Available Sensor Types](#)<sup>[291]</sup> section to find detailed information about every sensor type.

## More

Knowledge Base: How can I change the number of entries in most used sensor types?

- <http://kb.paessler.com/en/topic/59788>

## 6.3 Manage Device Tree

While viewing the device tree (or parts of it), click on the **Management** tab to enter a different tree view which shows your devices and sensors in a less colorful way. While in this view, you can move monitoring objects using **drag&drop** in your browser window. You can also view and edit object settings by selecting it. Changes take effect immediately. When done, leave the **Management** tab.

In order to arrange objects in the tree, you have the following options:

### Drag&Drop a Sensor

You can either move a sensor within the same device, or clone a sensor to another device.

- Within the same device, drag any sensor and drop it to the place where you want to have it. A shade will show the future position. When dropping, the sensor will be **moved** to this position and existing sensors will be lined up after it. This is a very easy way to reposition your sensors.
- Drag any sensor from one device and drop it on another to **clone** a sensor. This will create the same sensor type, with the same settings, on the new device, while maintaining the original sensor. A shade will show the future position. **Note:** Cloned sensors are put to **Pause** status initially to give you the chance to change any settings before monitoring begins. Please check the [settings](#)<sup>[142]</sup> and [resume](#)<sup>[162]</sup> monitoring.

**Note:** You cannot clone 'fixed' objects, such as the root group or a probe device. You cannot clone the sensor types [QoS \(Quality of Service\) One Way Sensor](#)<sup>[820]</sup> and [QoS \(Quality of Service\) Round Trip Sensor](#)<sup>[826]</sup>.

**Note:** In order to **clone** entire groups or devices, please use the [Clone Object](#)<sup>[1734]</sup> functionality accessible via the objects' [Context Menu](#)<sup>[163]</sup>.

### Drag&Drop a Group or Device

You can change a group's or device's position by using drag&drop.

- Within the same probe or group, drag any group or device and move it up or down in the device tree. A small red arrow will appear, showing the future position. When dropping, the group or device will be moved to this position and existing probes, groups, and devices will be lined up underneath. This is a very easy way to reposition your groups or devices.
- Drag any group or device from one probe or group and drop it on another probe or group. A small red arrow will appear, showing the future position. When dropping, the group or device will be moved to the new probe or group. Existing groups and devices will be lined up underneath. This is a very easy way to change the probe a group or device is part of, or to add groups or devices to other groups.

**Note:** The **Local Probe** and Remote Probes cannot be moved.

## Multi-Edit Object Properties

You can use Multi-Edit for object settings:

- Hold down the **Ctrl** key and select multiple groups, devices, or sensors (one of a kind).
- In the appearing dialog, select the settings you would like to edit, change the according values and click on **Save**. The changes will be applied to all selected objects.

The dialog is the same as described in the [Multi-Edit](#)  (Edit Settings) section.

- [Arrange Objects](#) 
- [Create Device Template](#) 
- [Clone Object](#) 

## 6.4 Root Group Settings

On the **Root** group's overview page, click on the **Settings** tab to change settings.

### The Root Group is Special

The **Root** group is the highest instance in the object hierarchy of your PRTG setup and parent to all other objects. Therefore, all objects inherit settings from the **Root** group. If you define important settings on this high level, work will be easier later on. So, before you create your own sensors, it is a good idea to review the **Root** group's settings to ensure they suit your network. There are already reasonable presets made with installation.

**Note:** If necessary, you can override every setting for every single child object later. To do so, simply disable the respective **Inherit** option of an object.

### Root Group Settings

The following settings are available in the **Settings** tab. As you may not need all of these, just regard those settings you really need, ignoring the others. All settings you define here can easily be inherited to all other objects in your setup.

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

Basic Group Settings	
Group Name	Enter a meaningful name to identify the group. The name will be shown by default in the devices tree and in all alarms.
Status	Define if monitoring for this group is started or paused. Choose between: <ul style="list-style-type: none"><li>▪ <b>Started:</b> Monitor this group.</li><li>▪ <b>Paused:</b> Pause monitoring for this group. All sensors on all devices in this group will be paused until this setting is changed again.</li></ul>

Location	
Location (for geo maps)	<p>When using <a href="#">geo maps using Google's API</a><sup>[1744]</sup> please enter a location in the first line. Objects will then be displayed on a geographical map with a flag, showing the current status using a color code similar to the <a href="#">sensor status icons</a><sup>[121]</sup> (green - yellow - orange - red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, PRTG will parse latitude and longitude automatically; for example: <b>49.452778 11.077778</b> or <b>enter 49.452778 any 11.077778 text</b></p> <p>A minus sign (-) in the first line will hide an object from geo maps. In this case you can enter location information in line two and following.</p> <p>You can define a specific label for each location: enter a string denoting the label in the first line and provide geo coordinates in the second line. This object will be displayed then with the label in PRTG's geo map.</p>

Credentials for Windows Systems	
Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, please enter the computer name here. If you want to use a Windows domain user account (recommended), please enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Please do <b>not</b> leave this field empty.
Username	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems	
Username	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	<p>Define which authentication method will be used for login. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Login via Password:</b> Provide a password for login. Enter below.</li> </ul>

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems	
	<ul style="list-style-type: none"> <li>▪ <b>Login via Private Key:</b> Provide a private key for authentication. <b>Note:</b> PRTG can only handle keys in OpenSSH format which are <b>not</b> encrypted. You cannot use password protected keys here. In the text field, please paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, please see <a href="#">Monitoring via SSH</a>.</li> </ul>
Password	This field is only visible if password login is selected above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	This field is only visible if private key login is selected above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges. <b>Note:</b> If you do not insert a private key for the first time, but <b>change</b> the private key, you need to restart your PRTG core server service in order for the private key change to take effect! For details, please see <a href="#">Monitoring via SSH</a> .
For WBEM Use Protocol	Define the protocol that will be used for WBEM. This setting is only relevant when using WBEM sensors. Choose between: <ul style="list-style-type: none"> <li>▪ <b>HTTP:</b> Use an unencrypted connection for WBEM.</li> <li>▪ <b>HTTPS:</b> Use an SSL-encrypted connection for WBEM.</li> </ul>
For WBEM Use Port	Define the port that will be used for WBEM. This setting is only relevant when using WBEM sensors. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Set automatically (port 5988 or 5989):</b> Use one of the standard ports, depending on whether unencrypted or encrypted connection is chosen above.</li> <li>▪ <b>Set manually:</b> Use a custom port. Define below.</li> </ul>
WBEM Port	This setting is only visible if manual port selection is enabled above. Enter the WBEM port number.
SSH Port	Define the port number which will be used for SSH connections. <b>Note:</b> By default, this setting is automatically used for all <a href="#">SSH sensors</a> , unless you define a different port number in the sensor settings.
SSH Rights Elevation	Define with which rights the command will be executed on the target system. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Run the command as the user connecting (default):</b> Use the rights of the user who establishes the SSH connection.</li> </ul>

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems	
	<ul style="list-style-type: none"> <li>▪ <b>Run the command as another user using 'sudo':</b> Use the rights of another user, for example, the administrator.</li> <li>▪ <b>Run the command as another user using 'su':</b> Use the rights of another target user.</li> </ul>
Target Username	This field is only visible if <b>sudo</b> or <b>su</b> is enabled above. Enter a username to run the specified command as another user than root. If you leave this field empty, the command will be run as root. Ensure that you set the Linux password even you use a public/private key for authentication. This is not necessary if the user is allowed to execute the command without a password.
Password Target User	This field is only visible if <b>su</b> is enabled above. Enter the password for the specified target user.

Credentials for VMware/XenServer	
User	Enter a login name for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
VMware Protocol	<p>Define the protocol used for the connection to VMware and XenServer. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>HTTPS (recommended):</b> Use an SSL-encrypted connection to VMware and XenServers.</li> <li>▪ <b>HTTP:</b> Use an unencrypted connection to VMware and XenServers.</li> </ul>

Credentials for SNMP Devices	
SNMP Version	<p>Select the SNMP version that will be used for device connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>v1:</b> Use the simple standard v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.</li> <li>▪ <b>v2c:</b> Use the more advanced v2c protocol for SNMP connections. Data is still transferred as clear-text, but it supports 64-bit counters.</li> <li>▪ <b>v3:</b> Use the latest v3 protocol for SNMP connections. It provides secure authentication and data encryption.</li> </ul>

Credentials for SNMP Devices	
	<p><b>Note for SNMP v3:</b> Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" reading of the probe health sensor, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.</p>
Community String	<p>This setting is only visible if SNMP version v1 or v2c are enabled above. Enter the community string of your devices. This is a kind of "clear-text password" used for simple authentication. We recommend using the default value.</p>
Authentication Type	<p>This setting is only visible if SNMP version v3 is enabled above. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>MD5:</b> Use <b>Message-Digest Algorithm 5</b> (MD5) for authentication.</li> <li>▪ <b>SHA:</b> Use <b>Secure Hash Algorithm</b> (SHA) for authentication.</li> </ul> <p>The chosen type has to match the authentication type of your device.</p> <p><b>Note:</b> If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field <b>password</b> empty. In this case, <b>SNMP_SEC_LEVEL_NOAUTH</b> will be used and authentication will be deactivated entirely.</p>
User	<p>This setting is only visible if SNMP version v3 is enabled above. Enter a username for secure authentication. This value has to match the username of your device.</p>
Password	<p>This setting is only visible if SNMP version v3 is enabled above. Enter a password for secure authentication. This value has to match the password of your device.</p>
Encryption Type	<p>This setting is only visible if SNMP version v3 is enabled above. Select an encryption type. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>DES:</b> Use <b>Data Encryption Standard</b> (DES) as encryption algorithm.</li> <li>▪ <b>AES:</b> Use <b>Advanced Encryption Standard</b> (AES) as encryption algorithm.</li> </ul> <p>The chosen type has to match the encryption type of your device.</p>

Credentials for SNMP Devices	
Data Encryption Key	This setting is only visible if SNMP version v3 is enabled above. Enter an encryption key here. If you provide a key in this field, SNMP data packets will be encrypted using the encryption algorithm selected above, providing increased security. The provided key here has to match the encryption key of your device. <b>Note:</b> If the key entered in this field does not match the key configured in the target SNMP device, you will not get an error message! Please enter a string or leave the field empty.
Context Name	This setting is only visible if SNMP version v3 is enabled above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port used for SNMP communication. We recommend using the default value.
SNMP Timeout (sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered.

Windows Compatibility Options	
When experiencing problems while monitoring via Windows sensors, you can set some compatibility options for trouble shooting.	
Preferred Data Source	<p>Define the method Windows sensors will use to query data. This setting is valid only for hybrid sensors offering performance counter and Windows Management Instrumentation (WMI) technology. The setting will be ignored for all other sensors! Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Performance Counters and fallback to WMI (recommended):</b> Try to query data via performance counters. If this is not possible, establish a connection via WMI. This is the recommended setting to best balance resource usage and functionality.</li> <li>▪ <b>Performance Counters only:</b> Query data via performance counters only. If this is not possible, a sensor will return no data.</li> <li>▪ <b>WMI only:</b> Query data via WMI only. If this is not possible, a sensor will return no data.</li> </ul>
Timeout Method	Specify the time the sensor will wait for the return of its WMI query before aborting it with an error message. Choose between:

Windows Compatibility Options	
	<ul style="list-style-type: none"> <li>▪ <b>Use 1.5x scanning interval (recommended):</b> Use a default of one and a half times the scanning interval set for the sensor (see below in this settings).</li> <li>▪ <b>Set manually:</b> Enter a timeout value manually.</li> </ul> <p>We recommend using the default value. Only if you experience ongoing timeout errors, try increasing the timeout value.</p>
Timeout Value (Sec.)	This field is only visible if the manual timeout method is selected above. Specify the time the sensor will wait for the return of its WMI query before aborting with an error message. Please enter an integer value.

SNMP Compatibility Options	
When experiencing problems while monitoring via Simple Network Management Protocol (SNMP) sensors, you can set some compatibility options for trouble shooting.	
SNMP Delay (ms)	Add a time in milliseconds that will be waited between two SNMP requests. This can help increase device compatibility. Please enter an integer value. We recommend using the default value. If you experience SNMP connection failures, please increase it. You can define a delay between 0 and 100, higher delays are not supported and will be discarded.
Failed Requests	<p>Define if an SNMP sensor will try again after a request fails.</p> <ul style="list-style-type: none"> <li>▪ <b>Retry (recommended):</b> Try again if an SNMP request fails. This can help prevent false error messages due to temporary timeout failures.</li> <li>▪ <b>Do not retry:</b> Do not retry if an SNMP request fails. With this setting enabled an SNMP sensor will be set to error status earlier.</li> </ul>
Overflow Values	<p>Define how PRTG will handle overflow values. Some devices do not handle internal buffer overflows correctly. This can cause false peaks.</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore overflow values (recommended):</b> Ignore overflow values and do not include them in the monitoring data.</li> <li>▪ <b>Handle overflow values as valid results:</b> Regard all overflow values as regular data and include them in the monitoring data.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>
Zero Values	Define how PRTG will handle zero values. Some devices send incorrect zero values. This can cause false peaks.

SNMP Compatibility Options	
	<ul style="list-style-type: none"> <li>▪ <b>Ignore zero values for delta sensors (recommended):</b> Ignore zero values and do not include them in the monitoring data.</li> <li>▪ <b>Handle zero values as valid results for delta sensors:</b> Regard all zero values as regular data and include them in the monitoring data.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>
32-bit/64-bit Counters	<p>Define which kind of traffic counters PRTG will search for on a device.</p> <ul style="list-style-type: none"> <li>▪ <b>Use 64-bit counters if available (recommended):</b> The interface scan will use 64-bit traffic counters, if available. This can avoid buffer overflows in the devices.</li> <li>▪ <b>Use 32-bit counters only:</b> The interface scan will always use 32-bit traffic counters, even if 64-bit counters are available. This can lead to more reliable monitoring for some devices.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>
Request Mode	<p>Define which kind of request method PRTG uses for SNMP sensors.</p> <ul style="list-style-type: none"> <li>▪ <b>Use multi get (recommended):</b> Bundle multiple SNMP requests into one request.</li> <li>▪ <b>Use single get:</b> Use one request for each SNMP value. This can increase compatibility with older devices.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>
Port Name Template	<p>Define how the name of SNMP sensors created on a device will be put together. Enter a template using several variables. When adding new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID usually several fields are available with interface descriptions. They are different for every device/OID. PRTG will use the information in these fields to name the sensors. If a field is empty or not available, an empty string is added to the name. As default, <b>[port] [ifalias]</b> is set as port name template, which will create a name such as <b>(001) Ethernet1</b>, for example. You can use any field names available at a certain OID of your device, among which are:</p> <ul style="list-style-type: none"> <li>▪ <b>[port]:</b> The port number of the monitored interface.</li> <li>▪ <b>[ifalias]:</b> The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling.</li> <li>▪ <b>[ifname]:</b> The textual name of the monitored interface as assigned by the local device.</li> </ul>

SNMP Compatibility Options	
	<ul style="list-style-type: none"> <li>▪ <b>[ifindex]</b>: A unique value, greater than zero, for the monitored interface.</li> <li>▪ <b>[ifdescr]</b>: A textual string containing information about the monitored device or interface, for example, manufacturer, product name, version.</li> <li>▪ <b>[ifspeed]</b>: An estimate of the monitored interface's current bandwidth (KBit/s).</li> </ul> <p>Combine them as you like to obtain suitable sensor names. See the <b>More</b> section below for more information about SNMP sensor names.</p>
Port Name Update	<p>Define how PRTG will react if you change port names in your physical device (e.g. a switch or router). Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Keep port names (use this if you edit the names in PRTG)</b>: Do not automatically adjust sensor names. This is the best option if you want to change names in PRTG manually.</li> <li>▪ <b>Automatic sensor name update if name changes in device</b>: If PRTG detects changes of port names in your physical device, it will try to automatically adjust sensor names accordingly. For detailed information please see <b>More</b> section below.</li> </ul>
Port Identification	<p>Define which field will be used for SNMP interface identification. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Automatic (recommended)</b>: Tries the ifAlias field first to identify an SNMP interface and then ifDescr. <b>Note</b>: ifName will not be tried automatically.</li> <li>▪ <b>Use ifAlias</b>: For most devices ifAlias is the best field to get unique interface names.</li> <li>▪ <b>Use ifDescr</b>: Use this option if the port order of your device changes after a reboot, and there is no ifAlias field available. For example, this is the best option for Cisco ASA devices. <b>Note</b>: When using this option it is important that your device returns unique interface names in the ifDescr field.</li> <li>▪ <b>Use ifName</b>: You can also use this option if there is no unique ifAlias available. <b>Note</b>: When using this option it is important that your device returns unique interface names in the ifName field.</li> <li>▪ <b>No Port Update</b>: Use this option to disable automatic port identification.</li> </ul>
Start Port	<p>For SNMP Traffic sensors, define at which port number PRTG will start to create sensors. Use <b>0</b> for automatic. We recommend using the default value.</p>

### SNMP Compatibility Options

End Port	For SNMP Traffic sensors, define at which port number PRTG will stop to create sensors. Use <b>0</b> for automatic. We recommend using the default value.
SNMP Debug Log	<p>Define if you want to create an SNMP log file for debugging purposes. This is only recommended for debugging low level SNMP issues. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No log (recommended):</b> No SNMP debug log file will be created.</li> <li>▪ <b>Enable debug log:</b> An SNMP log file is written to the <b>Logs (Debug)</b> directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>2074</sup> section.</li> </ul>

### Proxy Settings for HTTP Sensors

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. <b>Note:</b> This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see <a href="#">System Administration—Core &amp; Probes</a> <sup>1849</sup> .
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to pause monitoring for a certain time span (days, hours) throughout the week. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>[1817]</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency settings are available only in [Probe Settings](#)<sup>[238]</sup>, [Group Settings](#)<sup>[253]</sup>, [Device Settings](#)<sup>[272]</sup>, and [Sensor Settings](#)<sup>[290]</sup>.

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

Automatic Monitoring Data Analysis	
Unusual Detection	<p>Define if unusual detection is enabled for sensors. You can configure the behavior of unusual detection (or disable it completely) in the <a href="#">system settings</a><sup>[1839]</sup>.</p> <ul style="list-style-type: none"> <li>▪ <b>Enabled:</b> Enable unusual detection for this group. Sensors in this group will turn to orange color if unusual activity is detected.</li> <li>▪ <b>Disabled:</b> Disable unusual detection for this group. Unusual values will be ignored for sensors in this group; they will not show an unusual sensor status.</li> </ul>
Similar Sensors Detection	<p>Define if similar sensors detection is enabled for sensors. You can configure the depth of analysis of similar sensors detection (or disable it completely) in the <a href="#">system settings</a><sup>[1840]</sup>.</p> <ul style="list-style-type: none"> <li>▪ <b>Enabled:</b> Enable similar sensors detection for this group. Sensors in this group will be considered during similarity analysis.</li> <li>▪ <b>Disabled:</b> Disable similar detection for this group. Sensors in this group will not be taken into account during similarity analysis.</li> </ul>

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

## Notifications

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to you needs. In an object's detail page, click on the **Notifications** tab to change sensor notification triggers. The defined triggers will be inherited down to sensor level. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.5 Probe Settings

On a probe's overview page, click on the **Settings** tab to change settings.

### Add Remote Probe

You can add additional remote probes to your setup to extend your monitoring to networks that are not directly reachable by your PRTG core installation or cluster.

See [Add Remote Probe](#)<sup>[2049]</sup> section for more details.

### Probe Settings

The following settings are available in the **Settings** tab of every probe. As you may not need all of these for every probe, just regard those settings you really need, ignoring the others.

We recommend defining as many settings as possible in the [Root](#)<sup>[224]</sup> group, so you can inherit them to all other objects further down in the tree hierarchy.

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

Basic Probe Settings	
Probe Name	Enter a meaningful name to identify the probe. The name will be shown by default in the devices tree and in all alarms.
Tags	Enter one or more tags; confirm each tag by hitting space, comma, or enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case sensitive.
Status	Choose if monitoring for this probe is started or paused. <ul style="list-style-type: none"><li>▪ <b>Started:</b> Monitor this probe.</li><li>▪ <b>Paused:</b> Pause monitoring for this probe. All sensors on all devices on this probe will be paused until this setting is changed again.</li></ul>
Priority	Select a priority for the probe. This setting determines where the probe will be placed in list views. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>[224]</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Location	
Location (for geo maps)	<p>When using <a href="#">geo maps using Google's API</a><sup>[1744]</sup> please enter a location in the first line. Objects will then be displayed on a geographical map with a flag, showing the current status using a color code similar to the <a href="#">sensor status icons</a><sup>[121]</sup> (green - yellow - orange - red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, PRTG will parse latitude and longitude automatically; for example: <b>49.452778 11.077778</b> or <b>enter 49.452778 any 11.077778 text</b></p> <p>A minus sign (-) in the first line will hide an object from geo maps. In this case you can enter location information in line two and following.</p> <p>You can define a specific label for each location: enter a string denoting the label in the first line and provide geo coordinates in the second line. This object will be displayed then with the label in PRTG's geo map.</p>

Credentials for Windows Systems	
Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, please enter the computer name here. If you want to use a Windows domain user account (recommended), please enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Please do <b>not</b> leave this field empty.
Username	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems	
Username	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	<p>Define which authentication method will be used for login. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Login via Password:</b> Provide a password for login. Enter below.</li> <li>▪ <b>Login via Private Key:</b> Provide a private key for authentication. <b>Note:</b> PRTG can only handle keys in OpenSSH format which are <b>not</b> encrypted. You cannot use password protected keys here. In the text field, please paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, please see <a href="#">Monitoring via SSH</a><sup>1962</sup>.</li> </ul>
Password	This field is only visible if password login is selected above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	This field is only visible if private key login is selected above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges. <b>Note:</b> If you do not insert a private key for the first time, but <b>change</b> the private key, you need to restart your PRTG core server service in order for the private key change to take effect! For details, please see <a href="#">Monitoring via SSH</a> <sup>1962</sup> .
For WBEM Use Protocol	<p>Define the protocol that will be used for WBEM. This setting is only relevant when using WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>HTTP:</b> Use an unencrypted connection for WBEM.</li> <li>▪ <b>HTTPS:</b> Use an SSL-encrypted connection for WBEM.</li> </ul>
For WBEM Use Port	<p>Define the port that will be used for WBEM. This setting is only relevant when using WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Set automatically (port 5988 or 5989):</b> Use one of the standard ports, depending on whether unencrypted or encrypted connection is chosen above.</li> <li>▪ <b>Set manually:</b> Use a custom port. Define below.</li> </ul>
WBEM Port	This setting is only visible if manual port selection is enabled above. Enter the WBEM port number.
SSH Port	<p>Define the port number which will be used for SSH connections.</p> <p><b>Note:</b> By default, this setting is automatically used for all <a href="#">SSH sensors</a><sup>296</sup>, unless you define a different port number in the sensor settings.</p>

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems	
SSH Rights Elevation	<p>Define with which rights the command will be executed on the target system. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Run the command as the user connecting (default):</b> Use the rights of the user who establishes the SSH connection.</li> <li>▪ <b>Run the command as another user using 'sudo':</b> Use the rights of another user, for example, the administrator.</li> <li>▪ <b>Run the command as another user using 'su':</b> Use the rights of another target user.</li> </ul>
Target Username	<p>This field is only visible if <b>sudo</b> or <b>su</b> is enabled above. Enter a username to run the specified command as another user than root. If you leave this field empty, the command will be run as root. Ensure that you set the Linux password even you use a public/private key for authentication. This is not necessary if the user is allowed to execute the command without a password.</p>
Password Target User	<p>This field is only visible if <b>su</b> is enabled above. Enter the password for the specified target user.</p>

Credentials for VMware/XenServer	
User	Enter a login name for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
VMware Protocol	<p>Define the protocol used for the connection to VMware and XenServer. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>HTTPS (recommended):</b> Use an SSL-encrypted connection to VMware and XenServers.</li> <li>▪ <b>HTTP:</b> Use an unencrypted connection to VMware and XenServers.</li> </ul>

Credentials for SNMP Devices	
SNMP Version	<p>Select the SNMP version that will be used for device connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>v1:</b> Use the simple standard v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.</li> </ul>

Credentials for SNMP Devices	
	<ul style="list-style-type: none"> <li>▪ <b>v2c</b>: Use the more advanced v2c protocol for SNMP connections. Data is still transferred as clear-text, but it supports 64-bit counters.</li> <li>▪ <b>v3</b>: Use the latest v3 protocol for SNMP connections. It provides secure authentication and data encryption.</li> </ul> <p><b>Note for SNMP v3:</b> Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" reading of the probe health sensor, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.</p>
Community String	This setting is only visible if SNMP version v1 or v2c are enabled above. Enter the community string of your devices. This is a kind of "clear-text password" used for simple authentication. We recommend using the default value.
Authentication Type	<p>This setting is only visible if SNMP version v3 is enabled above. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>MD5</b>: Use <b>Message-Digest Algorithm 5</b> (MD5) for authentication.</li> <li>▪ <b>SHA</b>: Use <b>Secure Hash Algorithm</b> (SHA) for authentication.</li> </ul> <p>The chosen type has to match the authentication type of your device.</p> <p><b>Note:</b> If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field <b>password</b> empty. In this case, <b>SNMP_SEC_LEVEL_NOAUTH</b> will be used and authentication will be deactivated entirely.</p>
User	This setting is only visible if SNMP version v3 is enabled above. Enter a username for secure authentication. This value has to match the username of your device.
Password	This setting is only visible if SNMP version v3 is enabled above. Enter a password for secure authentication. This value has to match the password of your device.
Encryption Type	<p>This setting is only visible if SNMP version v3 is enabled above. Select an encryption type. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>DES</b>: Use <b>Data Encryption Standard</b> (DES) as encryption algorithm.</li> </ul>

Credentials for SNMP Devices	
	<ul style="list-style-type: none"> <li>▪ <b>AES:</b> Use <b>Advanced Encryption Standard</b> (AES) as encryption algorithm.</li> </ul> <p>The chosen type has to match the encryption type of your device.</p>
Data Encryption Key	<p>This setting is only visible if SNMP version v3 is enabled above. Enter an encryption key here. If you provide a key in this field, SNMP data packets will be encrypted using the encryption algorithm selected above, providing increased security. The provided key here has to match the encryption key of your device.</p> <p><b>Note:</b> If the key entered in this field does not match the key configured in the target SNMP device, you will not get an error message! Please enter a string or leave the field empty.</p>
Context Name	<p>This setting is only visible if SNMP version v3 is enabled above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.</p>
SNMP Port	<p>Enter the port used for SNMP communication. We recommend using the default value.</p>
SNMP Timeout (sec.)	<p>Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered.</p>

Windows Compatibility Options	
<p>When experiencing problems while monitoring via Windows sensors, you can set some compatibility options for trouble shooting.</p>	
Preferred Data Source	<p>Define the method Windows sensors will use to query data. This setting is valid only for hybrid sensors offering performance counter and Windows Management Instrumentation (WMI) technology. The setting will be ignored for all other sensors! Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Performance Counters and fallback to WMI (recommended):</b> Try to query data via performance counters. If this is not possible, establish a connection via WMI. This is the recommended setting to best balance resource usage and functionality.</li> <li>▪ <b>Performance Counters only:</b> Query data via performance counters only. If this is not possible, a sensor will return no data.</li> <li>▪ <b>WMI only:</b> Query data via WMI only. If this is not possible, a sensor will return no data.</li> </ul>

### Windows Compatibility Options

Timeout Method	<p>Specify the time the sensor will wait for the return of its WMI query before aborting it with an error message. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use 1.5x scanning interval (recommended):</b> Use a default of one and a half times the scanning interval set for the sensor (see below in this settings).</li> <li>▪ <b>Set manually:</b> Enter a timeout value manually.</li> </ul> <p>We recommend using the default value. Only if you experience ongoing timeout errors, try increasing the timeout value.</p>
Timeout Value (Sec.)	<p>This field is only visible if the manual timeout method is selected above. Specify the time the sensor will wait for the return of its WMI query before aborting with an error message. Please enter an integer value.</p>

### SNMP Compatibility Options

When experiencing problems while monitoring via Simple Network Management Protocol (SNMP) sensors, you can set some compatibility options for trouble shooting.

SNMP Delay (ms)	<p>Add a time in milliseconds that will be waited between two SNMP requests. This can help increase device compatibility. Please enter an integer value. We recommend using the default value. If you experience SNMP connection failures, please increase it. You can define a delay between <b>0</b> and <b>100</b>, higher delays are not supported and will be discarded.</p>
Failed Requests	<p>Define if an SNMP sensor will try again after a request fails.</p> <ul style="list-style-type: none"> <li>▪ <b>Retry (recommended):</b> Try again if an SNMP request fails. This can help prevent false error messages due to temporary timeout failures.</li> <li>▪ <b>Do not retry:</b> Do not retry if an SNMP request fails. With this setting enabled an SNMP sensor will be set to error status earlier.</li> </ul>
Overflow Values	<p>Define how PRTG will handle overflow values. Some devices do not handle internal buffer overflows correctly. This can cause false peaks.</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore overflow values (recommended):</b> Ignore overflow values and do not include them in the monitoring data.</li> <li>▪ <b>Handle overflow values as valid results:</b> Regard all overflow values as regular data and include them in the monitoring data.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>

SNMP Compatibility Options	
Zero Values	<p>Define how PRTG will handle zero values. Some devices send incorrect zero values. This can cause false peaks.</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore zero values for delta sensors (recommended):</b> Ignore zero values and do not include them in the monitoring data.</li> <li>▪ <b>Handle zero values as valid results for delta sensors:</b> Regard all zero values as regular data and include them in the monitoring data.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>
32-bit/64-bit Counters	<p>Define which kind of traffic counters PRTG will search for on a device.</p> <ul style="list-style-type: none"> <li>▪ <b>Use 64-bit counters if available (recommended):</b> The interface scan will use 64-bit traffic counters, if available. This can avoid buffer overflows in the devices.</li> <li>▪ <b>Use 32-bit counters only:</b> The interface scan will always use 32-bit traffic counters, even if 64-bit counters are available. This can lead to more reliable monitoring for some devices.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>
Request Mode	<p>Define which kind of request method PRTG uses for SNMP sensors.</p> <ul style="list-style-type: none"> <li>▪ <b>Use multi get (recommended):</b> Bundle multiple SNMP requests into one request.</li> <li>▪ <b>Use single get:</b> Use one request for each SNMP value. This can increase compatibility with older devices.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>
Port Name Template	<p>Define how the name of SNMP sensors created on a device will be put together. Enter a template using several variables. When adding new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID usually several fields are available with interface descriptions. They are different for every device/OID. PRTG will use the information in these fields to name the sensors. If a field is empty or not available, an empty string is added to the name. As default, <b>[port] [ifalias]</b> is set as port name template, which will create a name such as <b>(001) Ethernet1</b>, for example. You can use any field names available at a certain OID of your device, among which are:</p> <ul style="list-style-type: none"> <li>▪ <b>[port]:</b> The port number of the monitored interface.</li> <li>▪ <b>[ifalias]:</b> The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling.</li> </ul>

SNMP Compatibility Options	
	<ul style="list-style-type: none"> <li>▪ <b>[ifname]</b>: The textual name of the monitored interface as assigned by the local device.</li> <li>▪ <b>[ifindex]</b>: A unique value, greater than zero, for the monitored interface.</li> <li>▪ <b>[ifdescr]</b>: A textual string containing information about the monitored device or interface, for example, manufacturer, product name, version.</li> <li>▪ <b>[ifspeed]</b>: An estimate of the monitored interface's current bandwidth (KBit/s).</li> </ul> <p>Combine them as you like to obtain suitable sensor names. See the <b>More</b> section below for more information about SNMP sensor names.</p>
Port Name Update	<p>Define how PRTG will react if you change port names in your physical device (e.g. a switch or router). Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Keep port names (use this if you edit the names in PRTG)</b>: Do not automatically adjust sensor names. This is the best option if you want to change names in PRTG manually.</li> <li>▪ <b>Automatic sensor name update if name changes in device</b>: If PRTG detects changes of port names in your physical device, it will try to automatically adjust sensor names accordingly. For detailed information please see <b>More</b> section below.</li> </ul>
Port Identification	<p>Define which field will be used for SNMP interface identification. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Automatic (recommended)</b>: Tries the ifAlias field first to identify an SNMP interface and then ifDescr. <b>Note</b>: ifName will not be tried automatically.</li> <li>▪ <b>Use ifAlias</b>: For most devices ifAlias is the best field to get unique interface names.</li> <li>▪ <b>Use ifDescr</b>: Use this option if the port order of your device changes after a reboot, and there is no ifAlias field available. For example, this is the best option for Cisco ASA devices. <b>Note</b>: When using this option it is important that your device returns unique interface names in the ifDescr field.</li> <li>▪ <b>Use ifName</b>: You can also use this option if there is no unique ifAlias available. <b>Note</b>: When using this option it is important that your device returns unique interface names in the ifName field.</li> <li>▪ <b>No Port Update</b>: Use this option to disable automatic port identification.</li> </ul>

SNMP Compatibility Options	
Start Port	For SNMP Traffic sensors, define at which port number PRTG will start to create sensors. Use <b>0</b> for automatic. We recommend using the default value.
End Port	For SNMP Traffic sensors, define at which port number PRTG will stop to create sensors. Use <b>0</b> for automatic. We recommend using the default value.
SNMP Debug Log	<p>Define if you want to create an SNMP log file for debugging purposes. This is only recommended for debugging low level SNMP issues. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No log (recommended):</b> No SNMP debug log file will be created.</li> <li>▪ <b>Enable debug log:</b> An SNMP log file is written to the <b>Logs (Debug)</b> directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2014</sup> section.</li> </ul>

Proxy Settings for HTTP Sensors	
HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. <b>Note:</b> This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see <a href="#">System Administration—Core &amp; Probes</a> <sup>1849</sup> .
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Cluster Usage	
Scanning Distribution	This box is only visible if you're running a PRTG cluster. Sometimes you want to exclude a certain node from monitoring the sensors running on this probe, group, or device, for example, if a device is not reachable from every node configured in your cluster. In the list of cluster nodes, please select the nodes that will <b>not</b> be included in sensor scans. By default, this setting is <a href="#">inherited</a> <sup>87</sup> to all objects underneath.
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to pause monitoring for a certain time span (days, hours) throughout the week. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

Schedules, Dependencies, and Maintenance Window	
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current object if its parent object is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current object if its parent object is in a <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current object if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>159</sup> to choose an object on which the current object will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

Automatic Monitoring Data Analysis	
Unusual Detection	<p>Define if unusual detection is enabled for sensors. You can configure the behavior of unusual detection (or disable it completely) in the <a href="#">system settings</a><sup>[1839]</sup>.</p> <ul style="list-style-type: none"> <li>▪ <b>Enabled:</b> Enable unusual detection for this group. Sensors in this group will turn to orange color if unusual activity is detected.</li> <li>▪ <b>Disabled:</b> Disable unusual detection for this group. Unusual values will be ignored for sensors in this group; they will not show an unusual sensor status.</li> </ul>
Similar Sensors Detection	<p>Define if similar sensors detection is enabled for sensors. You can configure the depth of analysis of similar sensors detection (or disable it completely) in the <a href="#">system settings</a><sup>[1840]</sup>.</p> <ul style="list-style-type: none"> <li>▪ <b>Enabled:</b> Enable similar sensors detection for this group. Sensors in this group will be considered during similarity analysis.</li> <li>▪ <b>Disabled:</b> Disable similar detection for this group. Sensors in this group will not be taken into account during similarity analysis.</li> </ul>

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

## Notifications

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to you needs. In an object's detail page, click on the **Notifications** tab to change sensor notification triggers. The defined triggers will be inherited down to sensor level. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.6 Group Settings

On a group's overview page, click on the **Settings** tab to change settings.

### Add Group

The **Add Group** dialog appears when adding a new group to a parent group. It only shows the setting fields that are imperative for creating the group. Therefore, you will not see all setting fields in this dialog. For example, the **Group Status** option is not available in this step.

You can change all settings in the group's **Settings** tab later.

### Group Settings

The following settings are available in the **Settings** tab of every group. As you may not need all of these for every group, just regard those settings you really need, ignoring the others.

**Note:** This documentation does not refer to the setting of the special **Root** group. The settings available there differ from those described here.

We recommend defining as many settings as possible in the **Root**  group, so you can inherit them to all other objects further down in the tree hierarchy.

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

Basic Group Settings	
Group Name	Enter a meaningful name to identify the group. The name will be shown by default in the devices tree and in all alarms.
Status	<p>Choose if monitoring for this group is started or paused. We recommend using the default value. You can add additional tags to it, if you like.</p> <ul style="list-style-type: none"> <li>▪ <b>Started:</b> Monitor this group.</li> <li>▪ <b>Paused:</b> Pause monitoring for this group. All sensors on all devices in this group will be paused until this setting is changed again.</li> </ul>
Tags	Enter one or more tags; confirm each tag by hitting space, comma, or enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case sensitive.

Basic Group Settings	
Priority	Select a priority for the group. This setting determines where the group will be placed in list views. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Group Type	
Sensor Management	<p>Select which type of auto-discovery you would like to perform for this group. Choose between:</p> <ul style="list-style-type: none"><li>▪ <b>Manual (no auto-discovery):</b> Do not auto-discover any sensors, but only add sensors manually.</li><li>▪ <b>Automatic device identification (standard, recommended):</b> Use a small set of auto-discovery templates. This will scan your LAN and usually create a view standard sensors on your device.</li><li>▪ <b>Automatic device identification (detailed, may create many sensors):</b> Use an extended set of auto-discovery templates. This will scan your LAN and usually create many sensors on your device.</li><li>▪ <b>Automatic sensor creation using specific device templates:</b> Use specific auto-discovery templates only. Please select templates below. This will scan your LAN and add sensors defined in the template.</li></ul>
Device Template(s)	<p>This option is only visible if using specific device templates (last option) is enabled above. Please choose one or more templates by adding a check mark in front of the respective template name. You can also select and deselect all items by using the check box in the table head. These will be used for auto-discovery on the current device. Choose from:</p> <ul style="list-style-type: none"><li>▪ ADSL</li><li>▪ Cisco ASA VPN</li><li>▪ Cisco Device (Generic)</li><li>▪ Dell MDI</li><li>▪ DNS Server</li><li>▪ Environment Jakarta</li><li>▪ Environment Poseidon</li><li>▪ Fritzbox</li><li>▪ FTP Server</li><li>▪ Generic Device (PING only)</li></ul>

	<ul style="list-style-type: none"> <li>▪ <b>XEN Virtual Machines</b></li> </ul> <p>Once the auto-discovery is finished, PRTG will create a new <a href="#">ticket</a> <sup>149</sup> and list the device templates which were actually used to create new sensors. Templates which were not applied will not be shown in the ticket.</p>
Discovery Schedule	<p>Define when the auto-discovery will be run. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Once:</b> Perform auto-discovery only once. New devices and sensors will be added once. You can run auto-discovery manually any time using an object's <a href="#">context menu</a> <sup>163</sup>.</li> <li>▪ <b>Hourly:</b> Perform auto-discovery for new devices and sensors every 60 minutes. <b>Note:</b> Please use this option with caution! Frequently executed auto-discoveries might cause performance issues, especially when large network segments are scanned every hour.</li> <li>▪ <b>Daily:</b> Perform auto-discovery for new devices and sensors every 24 hours. The first auto-discovery will run immediately, all other discoveries will start on the time defined in the <b>Auto-Discovery Settings</b> section of the <a href="#">System Administration—Monitoring</a> <sup>1841</sup> settings.</li> <li>▪ <b>Weekly:</b> Perform auto-discovery for new devices and sensors every 7 days. The first auto-discovery will run immediately, all other discoveries will start on the time defined in the <b>Auto-Discovery Settings</b> section of the <a href="#">System Administration—Monitoring</a> <sup>1841</sup> settings.</li> </ul>
IP Selection Method	<p>Define how you want to define the IP range for auto-discovery. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Class C base IP with start/end (IPv4):</b> Define an IPv4 class C address range.</li> <li>▪ <b>List of individual IPs and DNS names (IPv4):</b> Enter a list of individual IPv4 addresses or DNS names.</li> <li>▪ <b>IP and Subnet (IPv4):</b> Enter an IPv4 address and subnet mask.</li> <li>▪ <b>IP with octet range (IPv4):</b> Enter an IPv4 address range for every IP octet individually. With this, you can define very customizable IP ranges.</li> <li>▪ <b>List of individual IPs and DNS names (IPv6):</b> Enter a list of individual IPv6 addresses or DNS names.</li> <li>▪ <b>Use computers from the active directory (maximum 1000 computers):</b> Search in the active directory for computers to perform auto-discovery.</li> </ul> <p><b>Note:</b> Only subnets with up to 65,536 IP addresses can be discovered! If you define a range with a higher number of addresses, discovery will stop before it is completed.</p>

IPv4 Base	This field is only visible if Class C network detection is selected above. Enter a class C network as IP base for the auto-discovery. Enter the first three octets of an IPv4 IP address, for example, <b>192.168.0</b>
IPv4 Range Start	This field is only visible if Class C network detection is selected above. Enter the IP octet of the class C network specified above from which PRTG will start the auto-discovery. This will complete the IP base above to an IPv4 address. For example, enter <b>1</b> to discover from <b>192.168.0.1</b> .
IPv4 Range End	This field is only visible if Class C network detection is selected above. Enter the IP octet of the class C network specified above at which PRTG will stop the auto-discovery. This will complete the IP base above to an IPv4 address. For example, enter <b>254</b> to discover up to <b>192.168.0.254</b> .
IPv4/DNS Name List IPv6/DNS Name List	This field is only visible if the IP list option is selected above. Enter a list of IP addresses or DNS names which the auto-discovery will scan. Enter each address in a separate line.
IPv4 and Subnet (IPv4)	This field is only visible if the IP and subnet option is selected above. Enter an expression in the format <b>address/subnet</b> , e.g. <b>192.168.3.0/255.255.255.0</b> . You can also use the short form like <b>192.168.3.0/24</b> in this example. PRTG will scan the complete host range (without network and broadcast address) defined by the IP address and the subnet mask.
IP with Octet Range	This field is only visible if the octet range option is selected above. Enter an expression in the format <b>a1.a2.a3.a4</b> , where <b>a1</b> , <b>a2</b> , <b>a3</b> , and <b>a4</b> are each a number between 0-255, or a range with two numbers and a hyphen like <b>1-127</b> . All permutations of all ranges are calculated, e.g. <b>10.0.1-10.1-100</b> results in 1,000 addresses that PRTG will scan during auto-discovery.
Organizational Unit	<p>This field is only visible if active directory is selected above. Enter an organizational unit (OU) to restrict the active directory search to computers which are part of this OU. Just enter the name of the OU without any other term (i.e., without "OU" in front). If you leave this field empty, there will not be any restriction.</p> <p>If you have sub-OUs, too, please consider the correct syntax in the format <b>Y,OU=X</b>: OUs that are part of another OU have to be listed together with their parent(s). Enter the sub-OU followed by <b>,OU=</b> and the name of the parent OU. For example, assuming that the organizational unit 'Y' is part of the OU named 'X'. Then the syntax would be <b>Y,OU=X</b>. For three OUs 'X', 'Y' part of 'X', and 'Z' part of 'Y', the syntax would be <b>Z,OU=Y,OU=X</b>. Note that the order is important, sub-OUs have to be listed left of its according parents!</p>

Name Resolution	<p>Define how newly discovered devices will be monitored. This only affects <b>new</b> devices. The setting for existing devices will be kept. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use DNS / WMI / SNMP names (recommended):</b> Monitor newly discovered devices via their DNS, WMI, or SNMP names (if available).</li> <li>▪ <b>Use IP addresses:</b> Monitor newly discovered devices via their IP address.</li> </ul> <p>We recommend using the default value.</p>
Device Rescan	<p>Define if you want to rescan known devices. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Skip auto-discovery for known devices/IPs (recommended):</b> Do not re-scan known devices or IP addresses, but only scan for new devices/IPs when auto-discovering. This can avoid re-creation of manually deleted sensors. PRTG will also avoid adding devices that are already included elsewhere in your configuration, e.g. in other groups.</li> <li>▪ <b>Perform auto-discovery for known devices/IPs:</b> Re-scan known devices and IP addresses with every auto-discovery. This will re-create manually deleted sensors on existing devices.</li> </ul> <p>We recommend using the default value.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>[224]</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Location	
Location (for geo maps)	<p>When using <a href="#">geo maps using Google's API</a><sup>[1744]</sup> please enter a location in the first line. Objects will then be displayed on a geographical map with a flag, showing the current status using a color code similar to the <a href="#">sensor status icons</a><sup>[121]</sup> (green - yellow - orange - red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, PRTG will parse latitude and longitude automatically; for example: <b>49.452778 11.077778</b> or <b>enter 49.452778 any 11.077778 text</b></p> <p>A minus sign (-) in the first line will hide an object from geo maps. In this case you can enter location information in line two and following.</p>

Location	
	You can define a specific label for each location: enter a string denoting the label in the first line and provide geo coordinates in the second line. This object will be displayed then with the label in PRTG's geo map.

Credentials for Windows Systems	
Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, please enter the computer name here. If you want to use a Windows domain user account (recommended), please enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Please do <b>not</b> leave this field empty.
Username	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems	
Username	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	<p>Define which authentication method will be used for login. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Login via Password:</b> Provide a password for login. Enter below.</li> <li>▪ <b>Login via Private Key:</b> Provide a private key for authentication. <b>Note:</b> PRTG can only handle keys in OpenSSH format which are <b>not</b> encrypted. You cannot use password protected keys here. In the text field, please paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, please see <a href="#">Monitoring via SSH</a> .</li> </ul>
Password	This field is only visible if password login is selected above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems	
Private Key	This field is only visible if private key login is selected above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges. <b>Note:</b> If you do not insert a private key for the first time, but <b>change</b> the private key, you need to restart your PRTG core server service in order for the private key change to take effect! For details, please see <a href="#">Monitoring via SSH</a> .
For WBEM Use Protocol	Define the protocol that will be used for WBEM. This setting is only relevant when using WBEM sensors. Choose between: <ul style="list-style-type: none"> <li>▪ <b>HTTP:</b> Use an unencrypted connection for WBEM.</li> <li>▪ <b>HTTPS:</b> Use an SSL-encrypted connection for WBEM.</li> </ul>
For WBEM Use Port	Define the port that will be used for WBEM. This setting is only relevant when using WBEM sensors. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Set automatically (port 5988 or 5989):</b> Use one of the standard ports, depending on whether unencrypted or encrypted connection is chosen above.</li> <li>▪ <b>Set manually:</b> Use a custom port. Define below.</li> </ul>
WBEM Port	This setting is only visible if manual port selection is enabled above. Enter the WBEM port number.
SSH Port	Define the port number which will be used for SSH connections. <b>Note:</b> By default, this setting is automatically used for all <a href="#">SSH sensors</a> , unless you define a different port number in the sensor settings.
SSH Rights Elevation	Define with which rights the command will be executed on the target system. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Run the command as the user connecting (default):</b> Use the rights of the user who establishes the SSH connection.</li> <li>▪ <b>Run the command as another user using 'sudo':</b> Use the rights of another user, for example, the administrator.</li> <li>▪ <b>Run the command as another user using 'su':</b> Use the rights of another target user.</li> </ul>
Target Username	This field is only visible if <b>sudo</b> or <b>su</b> is enabled above. Enter a username to run the specified command as another user than root. If you leave this field empty, the command will be run as root. Ensure that you set the Linux password even you use a public/private key for authentication. This is not necessary if the user is allowed to execute the command without a password.

### Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems

Password Target User	This field is only visible if <b>su</b> is enabled above. Enter the password for the specified target user.
----------------------	-------------------------------------------------------------------------------------------------------------

### Credentials for VMware/XenServer

User	Enter a login name for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
VMware Protocol	<p>Define the protocol used for the connection to VMware and XenServer. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>HTTPS (recommended):</b> Use an SSL-encrypted connection to VMware and XenServers.</li> <li>▪ <b>HTTP:</b> Use an unencrypted connection to VMware and XenServers.</li> </ul>

### Credentials for SNMP Devices

SNMP Version	<p>Select the SNMP version that will be used for device connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>v1:</b> Use the simple standard v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.</li> <li>▪ <b>v2c:</b> Use the more advanced v2c protocol for SNMP connections. Data is still transferred as clear-text, but it supports 64-bit counters.</li> <li>▪ <b>v3:</b> Use the latest v3 protocol for SNMP connections. It provides secure authentication and data encryption.</li> </ul> <p><b>Note for SNMP v3:</b> Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" reading of the probe health sensor, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.</p>
--------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Credentials for SNMP Devices	
Community String	This setting is only visible if SNMP version v1 or v2c are enabled above. Enter the community string of your devices. This is a kind of "clear-text password" used for simple authentication. We recommend using the default value.
Authentication Type	<p>This setting is only visible if SNMP version v3 is enabled above. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>MD5:</b> Use <b>Message-Digest Algorithm 5</b> (MD5) for authentication.</li> <li>▪ <b>SHA:</b> Use <b>Secure Hash Algorithm</b> (SHA) for authentication.</li> </ul> <p>The chosen type has to match the authentication type of your device.</p> <p><b>Note:</b> If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field <b>password</b> empty. In this case, <b>SNMP_SEC_LEVEL_NOAUTH</b> will be used and authentication will be deactivated entirely.</p>
User	This setting is only visible if SNMP version v3 is enabled above. Enter a username for secure authentication. This value has to match the username of your device.
Password	This setting is only visible if SNMP version v3 is enabled above. Enter a password for secure authentication. This value has to match the password of your device.
Encryption Type	<p>This setting is only visible if SNMP version v3 is enabled above. Select an encryption type. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>DES:</b> Use <b>Data Encryption Standard</b> (DES) as encryption algorithm.</li> <li>▪ <b>AES:</b> Use <b>Advanced Encryption Standard</b> (AES) as encryption algorithm.</li> </ul> <p>The chosen type has to match the encryption type of your device.</p>
Data Encryption Key	<p>This setting is only visible if SNMP version v3 is enabled above. Enter an encryption key here. If you provide a key in this field, SNMP data packets will be encrypted using the encryption algorithm selected above, providing increased security. The provided key here has to match the encryption key of your device.</p> <p><b>Note:</b> If the key entered in this field does not match the key configured in the target SNMP device, you will not get an error message! Please enter a string or leave the field empty.</p>

Credentials for SNMP Devices	
Context Name	This setting is only visible if SNMP version v3 is enabled above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port used for SNMP communication. We recommend using the default value.
SNMP Timeout (sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered.

Windows Compatibility Options	
When experiencing problems while monitoring via Windows sensors, you can set some compatibility options for trouble shooting.	
Preferred Data Source	<p>Define the method Windows sensors will use to query data. This setting is valid only for hybrid sensors offering performance counter and Windows Management Instrumentation (WMI) technology. The setting will be ignored for all other sensors! Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Performance Counters and fallback to WMI (recommended):</b> Try to query data via performance counters. If this is not possible, establish a connection via WMI. This is the recommended setting to best balance resource usage and functionality.</li> <li>▪ <b>Performance Counters only:</b> Query data via performance counters only. If this is not possible, a sensor will return no data.</li> <li>▪ <b>WMI only:</b> Query data via WMI only. If this is not possible, a sensor will return no data.</li> </ul>
Timeout Method	<p>Specify the time the sensor will wait for the return of its WMI query before aborting it with an error message. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use 1.5x scanning interval (recommended):</b> Use a default of one and a half times the scanning interval set for the sensor (see below in this settings).</li> <li>▪ <b>Set manually:</b> Enter a timeout value manually.</li> </ul> <p>We recommend using the default value. Only if you experience ongoing timeout errors, try increasing the timeout value.</p>

### Windows Compatibility Options

Timeout Value (Sec.)	This field is only visible if the manual timeout method is selected above. Specify the time the sensor will wait for the return of its WMI query before aborting with an error message. Please enter an integer value.
----------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### SNMP Compatibility Options

When experiencing problems while monitoring via Simple Network Management Protocol (SNMP) sensors, you can set some compatibility options for trouble shooting.

SNMP Delay (ms)	Add a time in milliseconds that will be waited between two SNMP requests. This can help increase device compatibility. Please enter an integer value. We recommend using the default value. If you experience SNMP connection failures, please increase it. You can define a delay between <b>0</b> and <b>100</b> , higher delays are not supported and will be discarded.
Failed Requests	<p>Define if an SNMP sensor will try again after a request fails.</p> <ul style="list-style-type: none"> <li>▪ <b>Retry (recommended):</b> Try again if an SNMP request fails. This can help prevent false error messages due to temporary timeout failures.</li> <li>▪ <b>Do not retry:</b> Do not retry if an SNMP request fails. With this setting enabled an SNMP sensor will be set to error status earlier.</li> </ul>
Overflow Values	<p>Define how PRTG will handle overflow values. Some devices do not handle internal buffer overflows correctly. This can cause false peaks.</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore overflow values (recommended):</b> Ignore overflow values and do not include them in the monitoring data.</li> <li>▪ <b>Handle overflow values as valid results:</b> Regard all overflow values as regular data and include them in the monitoring data.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>
Zero Values	<p>Define how PRTG will handle zero values. Some devices send incorrect zero values. This can cause false peaks.</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore zero values for delta sensors (recommended):</b> Ignore zero values and do not include them in the monitoring data.</li> <li>▪ <b>Handle zero values as valid results for delta sensors:</b> Regard all zero values as regular data and include them in the monitoring data.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>

SNMP Compatibility Options	
32-bit/64-bit Counters	<p>Define which kind of traffic counters PRTG will search for on a device.</p> <ul style="list-style-type: none"> <li>▪ <b>Use 64-bit counters if available (recommended):</b> The interface scan will use 64-bit traffic counters, if available. This can avoid buffer overflows in the devices.</li> <li>▪ <b>Use 32-bit counters only:</b> The interface scan will always use 32-bit traffic counters, even if 64-bit counters are available. This can lead to more reliable monitoring for some devices.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>
Request Mode	<p>Define which kind of request method PRTG uses for SNMP sensors.</p> <ul style="list-style-type: none"> <li>▪ <b>Use multi get (recommended):</b> Bundle multiple SNMP requests into one request.</li> <li>▪ <b>Use single get:</b> Use one request for each SNMP value. This can increase compatibility with older devices.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>
Port Name Template	<p>Define how the name of SNMP sensors created on a device will be put together. Enter a template using several variables. When adding new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID usually several fields are available with interface descriptions. They are different for every device/OID. PRTG will use the information in these fields to name the sensors. If a field is empty or not available, an empty string is added to the name. As default, <b>([port]) [ifalias]</b> is set as port name template, which will create a name such as <b>(001) Ethernet1</b>, for example. You can use any field names available at a certain OID of your device, among which are:</p> <ul style="list-style-type: none"> <li>▪ <b>[port]:</b> The port number of the monitored interface.</li> <li>▪ <b>[ifalias]:</b> The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling.</li> <li>▪ <b>[ifname]:</b> The textual name of the monitored interface as assigned by the local device.</li> <li>▪ <b>[ifindex]:</b> A unique value, greater than zero, for the monitored interface.</li> <li>▪ <b>[ifdescr]:</b> A textual string containing information about the monitored device or interface, for example, manufacturer, product name, version.</li> <li>▪ <b>[ifspeed]:</b> An estimate of the monitored interface's current bandwidth (KBit/s).</li> </ul>

SNMP Compatibility Options	
	Combine them as you like to obtain suitable sensor names. See the <b>More</b> section below for more information about SNMP sensor names.
Port Name Update	<p>Define how PRTG will react if you change port names in your physical device (e.g. a switch or router). Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Keep port names (use this if you edit the names in PRTG):</b> Do not automatically adjust sensor names. This is the best option if you want to change names in PRTG manually.</li> <li>▪ <b>Automatic sensor name update if name changes in device:</b> If PRTG detects changes of port names in your physical device, it will try to automatically adjust sensor names accordingly. For detailed information please see <b>More</b> section below.</li> </ul>
Port Identification	<p>Define which field will be used for SNMP interface identification. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Automatic (recommended):</b> Tries the ifAlias field first to identify an SNMP interface and then ifDescr. <b>Note:</b> ifName will not be tried automatically.</li> <li>▪ <b>Use ifAlias:</b> For most devices ifAlias is the best field to get unique interface names.</li> <li>▪ <b>Use ifDescr:</b> Use this option if the port order of your device changes after a reboot, and there is no ifAlias field available. For example, this is the best option for Cisco ASA devices. <b>Note:</b> When using this option it is important that your device returns unique interface names in the ifDescr field.</li> <li>▪ <b>Use ifName:</b> You can also use this option if there is no unique ifAlias available. <b>Note:</b> When using this option it is important that your device returns unique interface names in the ifName field.</li> <li>▪ <b>No Port Update:</b> Use this option to disable automatic port identification.</li> </ul>
Start Port	For SNMP Traffic sensors, define at which port number PRTG will start to create sensors. Use <b>0</b> for automatic. We recommend using the default value.
End Port	For SNMP Traffic sensors, define at which port number PRTG will stop to create sensors. Use <b>0</b> for automatic. We recommend using the default value.
SNMP Debug Log	<p>Define if you want to create an SNMP log file for debugging purposes. This is only recommended for debugging low level SNMP issues. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No log (recommended):</b> No SNMP debug log file will be created.</li> </ul>

### SNMP Compatibility Options

- **Enable debug log:** An SNMP log file is written to the **Logs (Debug)** directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see [Data Storage](#)<sup>[2074]</sup> section.

### Proxy Settings for HTTP Sensors

#### HTTP Proxy Settings

The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. **Note:** This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see [System Administration—Core & Probes](#)<sup>[1849]</sup>.

#### Name

Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.

#### Port

Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.

#### User

If the proxy requires authentication, enter the username for the proxy login. **Note:** Only basic authentication is available! Please enter a string or leave the field empty.

#### Password

If the proxy requires authentication, enter the password for the proxy login. **Note:** Only basic authentication is available! Please enter a string or leave the field empty.

### Scanning Interval

#### Scanning Interval

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>[1839]</sup>.

### Cluster Usage

#### Scanning Distribution

This box is only visible if you're running a PRTG cluster. Sometimes you want to exclude a certain node from monitoring the sensors running on this probe, group, or device, for example, if a device is not reachable from every node configured in your cluster. In the list of cluster nodes, please select the nodes that will **not** be included in sensor scans. By default, this setting is [inherited](#)<sup>[87]</sup> to all objects underneath.

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to pause monitoring for a certain time span (days, hours) throughout the week. You can create new schedules and edit existing ones in the <a href="#">account settings</a> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current object if its parent object is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current object if its parent object is in a <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current object if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>

### Schedules, Dependencies, and Maintenance Window

Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current object will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds.

### Access Rights

User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>
Automatic Monitoring Data Analysis	
Unusual Detection	<p>Define if unusual detection is enabled for sensors. You can configure the behavior of unusual detection (or disable it completely) in the <a href="#">system settings</a> <sup>1839</sup>.</p> <ul style="list-style-type: none"> <li>▪ <b>Enabled:</b> Enable unusual detection for this group. Sensors in this group will turn to orange color if unusual activity is detected.</li> <li>▪ <b>Disabled:</b> Disable unusual detection for this group. Unusual values will be ignored for sensors in this group; they will not show an unusual sensor status.</li> </ul>
Similar Sensors Detection	<p>Define if similar sensors detection is enabled for sensors. You can configure the depth of analysis of similar sensors detection (or disable it completely) in the <a href="#">system settings</a> <sup>1840</sup>.</p> <ul style="list-style-type: none"> <li>▪ <b>Enabled:</b> Enable similar sensors detection for this group. Sensors in this group will be considered during similarity analysis.</li> <li>▪ <b>Disabled:</b> Disable similar detection for this group. Sensors in this group will not be taken into account during similarity analysis.</li> </ul>
Number of Sensors Limitation	
Sensor Limit	<p>This setting allows the administrator to set a limit for the maximum number of sensors in this group. Subgroups are also included. If sensors exceed this limitation, they will be paused. This is of special interest for a Managed Service Provider (MSP). Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Allow unlimited number of sensors:</b> Disable a limitation of the number of sensors for this group. Any number of sensors can be added to this group.</li> </ul>

Number of Sensors Limitation	
	<ul style="list-style-type: none"> <li>▪ <b>Limit number of sensors in this group:</b> Enables a limitation of the number of sensors for this group. Only a limited number of sensors can be added to this group.</li> </ul>
Maximum Number of Sensors	This field is only visible if limitation is enabled above. Define how many sensors can be added to this group. Please enter an integer value.

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

## Notifications

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to your needs. In an object's detail page, click on the **Notifications** tab to change sensor notification triggers. The defined triggers will be inherited down to sensor level. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.7 Device Settings

On a device's details page, click on the **Settings** tab to change settings.

### Add Device

The **Add Device** dialog appears when adding a new device to a group. It only shows the setting fields that are imperative for creating the device. Therefore, you will not see all setting fields in this dialog. For example, the **Device Status** option is not available in this step.

You can change all settings in the device's **Settings** tab later.

### Device Settings

The following settings are available in the **Settings** tab of every device. As you may not need all of these for every device, just regard those settings you really need, ignoring the others.

We recommend defining as many settings as possible in the [Root](#)<sup>224</sup> group, so you can inherit them to all other objects further down in the tree hierarchy.

For device settings, there is also multi-edit available. This enables you to change properties of many devices at a time. For more details, please see [Multi-Edit Lists](#)<sup>1736</sup> section.

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

Basic Device Settings	
Device Name	Enter a meaningful name to identify the device. The name will be shown by default in the device tree and in all alarms.
Status	Choose if monitoring for this device is started or paused. <ul style="list-style-type: none"> <li>▪ <b>Started:</b> Monitor this device.</li> <li>▪ <b>Paused:</b> Pause monitoring for this device. All sensors on it will be paused until this setting is changed again.</li> </ul>
IP Version	Define which IP protocol PRTG will use to connect to this device. The setting is valid for all sensors created on this device. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Connect using IPv4:</b> Use IP version 4 for all requests to this device.</li> <li>▪ <b>Connect using IPv6:</b> Use IP version 6 for all requests to this device.</li> </ul>

Basic Device Settings	
IP Address/DNS Name	Enter the IP address (either v4 or v6, depending on your selection above) or DNS name for the device. Most sensors created on this device will inherit this setting and they will try to connect to this address for monitoring. (However, some sensor types still have their own setting for IP address/DNS name.)
Tags	Enter one or more tags; confirm each tag by hitting space, comma, or enter key. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Additional Device Information	
Device Icon	Choose a device icon from the list. It will be shown in the device tree. For information on how to add your custom icons, please see the link in the <a href="#">More</a> <sup>288</sup> section below.
Service URL	Specify a URL you would like to open directly when choosing <b>Device Tools   Go To Service URL</b> from the device's <a href="#">context menu</a> <sup>168</sup> . For example, you can configure this option to call the address <a href="http://www.example.com/service.html">http://www.example.com/service.html</a> . Enter a valid URL or leave the field empty.
Device Type	
Sensor Management	<p>Select which type of auto-discovery you would like to perform for this device. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Manual (no auto-discovery):</b> Do not auto-discover any sensors, but only add sensors manually.</li> <li>▪ <b>Automatic device identification (standard, recommended):</b> Use a small set of auto-discovery templates. This will scan your LAN and usually create a view standard sensors on your device.</li> <li>▪ <b>Automatic device identification (detailed, may create many sensors):</b> Use an extended set of auto-discovery templates. This will scan your LAN and usually create many sensors on your device.</li> </ul>

Device Type	
	<ul style="list-style-type: none"> <li>▪ <b>Automatic sensor creation using specific device templates:</b> Use specific auto-discovery templates only. Please select templates below. This will scan your LAN and add sensors defined in the template.</li> </ul>
Discovery Schedule	<p>This option is only visible if one of the auto-discovery options is selected above. Define when the auto-discovery will be run. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Once:</b> Perform auto-discovery only once. For existing devices, this will initiate a one-time sensor update for the current device.</li> <li>▪ <b>Hourly:</b> Perform auto-discovery for new sensors every hour.</li> <li>▪ <b>Daily:</b> Perform auto-discovery for new sensors every day.</li> <li>▪ <b>Weekly:</b> Perform auto-discovery for new sensors every week.</li> </ul>
Device Template(s)	<p>This option is only visible if using specific device templates (last option) is enabled above. Please choose one or more templates by adding a check mark in front of the respective template name. You can also select and deselect all items by using the check box in the table head. These will be used for auto-discovery on the current device. Choose from:</p> <ul style="list-style-type: none"> <li>▪ ADSL</li> <li>▪ Cisco ASA VPN</li> <li>▪ Cisco Device (Generic)</li> <li>▪ Dell MDI</li> <li>▪ DNS Server</li> <li>▪ Environment Jakarta</li> <li>▪ Environment Poseidon</li> <li>▪ Fritzbox</li> <li>▪ FTP Server</li> <li>▪ Generic Device (PING only)</li> <li>▪ Generic Device (SNMP-enabled)</li> <li>▪ Generic Device (SNMP-enabled, Detailed)</li> <li>▪ HTTP Web Server</li> <li>▪ Hyper V Host Server</li> <li>▪ Linux/UNIX Device (SNMP or SSH enabled)</li> <li>▪ Mail Server (Generic)</li> <li>▪ Mail Server (MS Exchange)</li> </ul>

Device Type	
	<ul style="list-style-type: none"> <li>▪ Microsoft Sharepoint 2010</li> <li>▪ NAS LenovoEMC</li> <li>▪ NAS QNAP</li> <li>▪ NAS Synology</li> <li>▪ NetApp</li> <li>▪ NTP Server</li> <li>▪ Printer (HP)</li> <li>▪ RDP Server</li> <li>▪ RMON compatible device</li> <li>▪ Server (Compaq/HP agents)</li> <li>▪ Server (Dell)</li> <li>▪ Sever Cisco UCS</li> <li>▪ Server IBM</li> <li>▪ SonicWALL</li> <li>▪ Switch (Cisco Catalyst)</li> <li>▪ Switch (Cisco IOS Based)</li> <li>▪ Switch (HP Procurve)</li> <li>▪ UNIX/Linux Device</li> <li>▪ UPS (APC)</li> <li>▪ Virtuozzo Server</li> <li>▪ VMware ESX / vCenter Server</li> <li>▪ Windows (Detailed via WMI)</li> <li>▪ Windows (via Remote Powershell)</li> <li>▪ Windows (via WMI)</li> <li>▪ Windows IIS (via SNMP)</li> <li>▪ XEN Hosts</li> <li>▪ XEN Virtual Machines</li> </ul> <p>Once the auto-discovery is finished, PRTG will create a new <a href="#">ticket</a> <sup>[149]</sup> and list the device templates which were actually used to create new sensors. Templates which were not applied will not be shown in the ticket.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>[224]</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Location	
Location (for geo maps)	<p>When using <a href="#">geo maps using Google's API</a><sup>[1744]</sup> please enter a location in the first line. Objects will then be displayed on a geographical map with a flag, showing the current status using a color code similar to the <a href="#">sensor status icons</a><sup>[121]</sup> (green - yellow - orange - red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, PRTG will parse latitude and longitude automatically; for example: <b>49.452778 11.077778</b> or <b>enter 49.452778 any 11.077778 text</b></p> <p>A minus sign (-) in the first line will hide an object from geo maps. In this case you can enter location information in line two and following.</p> <p>You can define a specific label for each location: enter a string denoting the label in the first line and provide geo coordinates in the second line. This object will be displayed then with the label in PRTG's geo map.</p>

Credentials for Windows Systems	
Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, please enter the computer name here. If you want to use a Windows domain user account (recommended), please enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Please do <b>not</b> leave this field empty.
Username	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems	
Username	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	<p>Define which authentication method will be used for login. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Login via Password:</b> Provide a password for login. Enter below.</li> <li>▪ <b>Login via Private Key:</b> Provide a private key for authentication. <b>Note:</b> PRTG can only handle keys in OpenSSH format which are <b>not</b> encrypted. You cannot use password protected keys here. In the text field, please paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, please see <a href="#">Monitoring via SSH</a><sup>1962</sup>.</li> </ul>
Password	This field is only visible if password login is selected above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	This field is only visible if private key login is selected above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges. <b>Note:</b> If you do not insert a private key for the first time, but <b>change</b> the private key, you need to restart your PRTG core server service in order for the private key change to take effect! For details, please see <a href="#">Monitoring via SSH</a> <sup>1962</sup> .
For WBEM Use Protocol	<p>Define the protocol that will be used for WBEM. This setting is only relevant when using WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>HTTP:</b> Use an unencrypted connection for WBEM.</li> <li>▪ <b>HTTPS:</b> Use an SSL-encrypted connection for WBEM.</li> </ul>
For WBEM Use Port	<p>Define the port that will be used for WBEM. This setting is only relevant when using WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Set automatically (port 5988 or 5989):</b> Use one of the standard ports, depending on whether unencrypted or encrypted connection is chosen above.</li> <li>▪ <b>Set manually:</b> Use a custom port. Define below.</li> </ul>
WBEM Port	This setting is only visible if manual port selection is enabled above. Enter the WBEM port number.
SSH Port	<p>Define the port number which will be used for SSH connections. <b>Note:</b> By default, this setting is automatically used for all <a href="#">SSH sensors</a><sup>296</sup>, unless you define a different port number in the sensor settings.</p>

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems	
SSH Rights Elevation	<p>Define with which rights the command will be executed on the target system. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Run the command as the user connecting (default):</b> Use the rights of the user who establishes the SSH connection.</li> <li>▪ <b>Run the command as another user using 'sudo':</b> Use the rights of another user, for example, the administrator.</li> <li>▪ <b>Run the command as another user using 'su':</b> Use the rights of another target user.</li> </ul>
Target Username	<p>This field is only visible if <b>sudo</b> or <b>su</b> is enabled above. Enter a username to run the specified command as another user than root. If you leave this field empty, the command will be run as root. Ensure that you set the Linux password even you use a public/private key for authentication. This is not necessary if the user is allowed to execute the command without a password.</p>
Password Target User	<p>This field is only visible if <b>su</b> is enabled above. Enter the password for the specified target user.</p>

Credentials for VMware/XenServer	
User	<p>Enter a login name for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.</p>
Password	<p>Enter a password for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.</p>
VMware Protocol	<p>Define the protocol used for the connection to VMware and XenServer. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>HTTPS (recommended):</b> Use an SSL-encrypted connection to VMware and XenServers.</li> <li>▪ <b>HTTP:</b> Use an unencrypted connection to VMware and XenServers.</li> </ul>

Credentials for SNMP Devices	
SNMP Version	<p>Select the SNMP version that will be used for device connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>v1:</b> Use the simple standard v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.</li> </ul>

Credentials for SNMP Devices	
	<ul style="list-style-type: none"> <li>▪ <b>v2c</b>: Use the more advanced v2c protocol for SNMP connections. Data is still transferred as clear-text, but it supports 64-bit counters.</li> <li>▪ <b>v3</b>: Use the latest v3 protocol for SNMP connections. It provides secure authentication and data encryption.</li> </ul> <p><b>Note for SNMP v3:</b> Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" reading of the probe health sensor, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.</p>
Community String	This setting is only visible if SNMP version v1 or v2c are enabled above. Enter the community string of your devices. This is a kind of "clear-text password" used for simple authentication. We recommend using the default value.
Authentication Type	<p>This setting is only visible if SNMP version v3 is enabled above. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>MD5</b>: Use <b>Message-Digest Algorithm 5</b> (MD5) for authentication.</li> <li>▪ <b>SHA</b>: Use <b>Secure Hash Algorithm</b> (SHA) for authentication.</li> </ul> <p>The chosen type has to match the authentication type of your device.</p> <p><b>Note:</b> If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field <b>password</b> empty. In this case, <b>SNMP_SEC_LEVEL_NOAUTH</b> will be used and authentication will be deactivated entirely.</p>
User	This setting is only visible if SNMP version v3 is enabled above. Enter a username for secure authentication. This value has to match the username of your device.
Password	This setting is only visible if SNMP version v3 is enabled above. Enter a password for secure authentication. This value has to match the password of your device.
Encryption Type	<p>This setting is only visible if SNMP version v3 is enabled above. Select an encryption type. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>DES</b>: Use <b>Data Encryption Standard</b> (DES) as encryption algorithm.</li> </ul>

Credentials for SNMP Devices	
	<ul style="list-style-type: none"> <li>▪ <b>AES:</b> Use <b>Advanced Encryption Standard</b> (AES) as encryption algorithm.</li> </ul> <p>The chosen type has to match the encryption type of your device.</p>
Data Encryption Key	<p>This setting is only visible if SNMP version v3 is enabled above. Enter an encryption key here. If you provide a key in this field, SNMP data packets will be encrypted using the encryption algorithm selected above, providing increased security. The provided key here has to match the encryption key of your device.</p> <p><b>Note:</b> If the key entered in this field does not match the key configured in the target SNMP device, you will not get an error message! Please enter a string or leave the field empty.</p>
Context Name	<p>This setting is only visible if SNMP version v3 is enabled above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.</p>
SNMP Port	<p>Enter the port used for SNMP communication. We recommend using the default value.</p>
SNMP Timeout (sec.)	<p>Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered.</p>

Windows Compatibility Options	
<p>When experiencing problems while monitoring via Windows sensors, you can set some compatibility options for trouble shooting.</p>	
Preferred Data Source	<p>Define the method Windows sensors will use to query data. This setting is valid only for hybrid sensors offering performance counter and Windows Management Instrumentation (WMI) technology. The setting will be ignored for all other sensors! Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Performance Counters and fallback to WMI (recommended):</b> Try to query data via performance counters. If this is not possible, establish a connection via WMI. This is the recommended setting to best balance resource usage and functionality.</li> <li>▪ <b>Performance Counters only:</b> Query data via performance counters only. If this is not possible, a sensor will return no data.</li> <li>▪ <b>WMI only:</b> Query data via WMI only. If this is not possible, a sensor will return no data.</li> </ul>

### Windows Compatibility Options

Timeout Method	<p>Specify the time the sensor will wait for the return of its WMI query before aborting it with an error message. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use 1.5x scanning interval (recommended):</b> Use a default of one and a half times the scanning interval set for the sensor (see below in this settings).</li> <li>▪ <b>Set manually:</b> Enter a timeout value manually.</li> </ul> <p>We recommend using the default value. Only if you experience ongoing timeout errors, try increasing the timeout value.</p>
Timeout Value (Sec.)	<p>This field is only visible if the manual timeout method is selected above. Specify the time the sensor will wait for the return of its WMI query before aborting with an error message. Please enter an integer value.</p>

### SNMP Compatibility Options

When experiencing problems while monitoring via Simple Network Management Protocol (SNMP) sensors, you can set some compatibility options for trouble shooting.

SNMP Delay (ms)	<p>Add a time in milliseconds that will be waited between two SNMP requests. This can help increase device compatibility. Please enter an integer value. We recommend using the default value. If you experience SNMP connection failures, please increase it. You can define a delay between <b>0</b> and <b>100</b>, higher delays are not supported and will be discarded.</p>
Failed Requests	<p>Define if an SNMP sensor will try again after a request fails.</p> <ul style="list-style-type: none"> <li>▪ <b>Retry (recommended):</b> Try again if an SNMP request fails. This can help prevent false error messages due to temporary timeout failures.</li> <li>▪ <b>Do not retry:</b> Do not retry if an SNMP request fails. With this setting enabled an SNMP sensor will be set to error status earlier.</li> </ul>
Overflow Values	<p>Define how PRTG will handle overflow values. Some devices do not handle internal buffer overflows correctly. This can cause false peaks.</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore overflow values (recommended):</b> Ignore overflow values and do not include them in the monitoring data.</li> <li>▪ <b>Handle overflow values as valid results:</b> Regard all overflow values as regular data and include them in the monitoring data.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>

SNMP Compatibility Options	
Zero Values	<p>Define how PRTG will handle zero values. Some devices send incorrect zero values. This can cause false peaks.</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore zero values for delta sensors (recommended):</b> Ignore zero values and do not include them in the monitoring data.</li> <li>▪ <b>Handle zero values as valid results for delta sensors:</b> Regard all zero values as regular data and include them in the monitoring data.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>
32-bit/64-bit Counters	<p>Define which kind of traffic counters PRTG will search for on a device.</p> <ul style="list-style-type: none"> <li>▪ <b>Use 64-bit counters if available (recommended):</b> The interface scan will use 64-bit traffic counters, if available. This can avoid buffer overflows in the devices.</li> <li>▪ <b>Use 32-bit counters only:</b> The interface scan will always use 32-bit traffic counters, even if 64-bit counters are available. This can lead to more reliable monitoring for some devices.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>
Request Mode	<p>Define which kind of request method PRTG uses for SNMP sensors.</p> <ul style="list-style-type: none"> <li>▪ <b>Use multi get (recommended):</b> Bundle multiple SNMP requests into one request.</li> <li>▪ <b>Use single get:</b> Use one request for each SNMP value. This can increase compatibility with older devices.</li> </ul> <p>We recommend using the default value. If you experience problems, change this option.</p>
Port Name Template	<p>Define how the name of SNMP sensors created on a device will be put together. Enter a template using several variables. When adding new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID usually several fields are available with interface descriptions. They are different for every device/OID. PRTG will use the information in these fields to name the sensors. If a field is empty or not available, an empty string is added to the name. As default, <b>[port] [ifalias]</b> is set as port name template, which will create a name such as <b>(001) Ethernet1</b>, for example. You can use any field names available at a certain OID of your device, among which are:</p> <ul style="list-style-type: none"> <li>▪ <b>[port]:</b> The port number of the monitored interface.</li> <li>▪ <b>[ifalias]:</b> The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling.</li> </ul>

SNMP Compatibility Options	
	<ul style="list-style-type: none"> <li>▪ <b>[ifname]</b>: The textual name of the monitored interface as assigned by the local device.</li> <li>▪ <b>[ifindex]</b>: A unique value, greater than zero, for the monitored interface.</li> <li>▪ <b>[ifdescr]</b>: A textual string containing information about the monitored device or interface, for example, manufacturer, product name, version.</li> <li>▪ <b>[ifspeed]</b>: An estimate of the monitored interface's current bandwidth (KBit/s).</li> </ul> <p>Combine them as you like to obtain suitable sensor names. See the <b>More</b> section below for more information about SNMP sensor names.</p>
Port Name Update	<p>Define how PRTG will react if you change port names in your physical device (e.g. a switch or router). Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Keep port names (use this if you edit the names in PRTG)</b>: Do not automatically adjust sensor names. This is the best option if you want to change names in PRTG manually.</li> <li>▪ <b>Automatic sensor name update if name changes in device</b>: If PRTG detects changes of port names in your physical device, it will try to automatically adjust sensor names accordingly. For detailed information please see <b>More</b> section below.</li> </ul>
Port Identification	<p>Define which field will be used for SNMP interface identification. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Automatic (recommended)</b>: Tries the ifAlias field first to identify an SNMP interface and then ifDescr. <b>Note</b>: ifName will not be tried automatically.</li> <li>▪ <b>Use ifAlias</b>: For most devices ifAlias is the best field to get unique interface names.</li> <li>▪ <b>Use ifDescr</b>: Use this option if the port order of your device changes after a reboot, and there is no ifAlias field available. For example, this is the best option for Cisco ASA devices. <b>Note</b>: When using this option it is important that your device returns unique interface names in the ifDescr field.</li> <li>▪ <b>Use ifName</b>: You can also use this option if there is no unique ifAlias available. <b>Note</b>: When using this option it is important that your device returns unique interface names in the ifName field.</li> <li>▪ <b>No Port Update</b>: Use this option to disable automatic port identification.</li> </ul>

SNMP Compatibility Options	
Start Port	For SNMP Traffic sensors, define at which port number PRTG will start to create sensors. Use <b>0</b> for automatic. We recommend using the default value.
End Port	For SNMP Traffic sensors, define at which port number PRTG will stop to create sensors. Use <b>0</b> for automatic. We recommend using the default value.
SNMP Debug Log	<p>Define if you want to create an SNMP log file for debugging purposes. This is only recommended for debugging low level SNMP issues. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No log (recommended):</b> No SNMP debug log file will be created.</li> <li>▪ <b>Enable debug log:</b> An SNMP log file is written to the <b>Logs (Debug)</b> directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>

Proxy Settings for HTTP Sensors	
HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. <b>Note:</b> This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see <a href="#">System Administration—Core &amp; Probes</a> <sup>1849</sup> .
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Cluster Usage	
Scanning Distribution	This box is only visible if you're running a PRTG cluster. Sometimes you want to exclude a certain node from monitoring the sensors running on this probe, group, or device, for example, if a device is not reachable from every node configured in your cluster. In the list of cluster nodes, please select the nodes that will <b>not</b> be included in sensor scans. By default, this setting is <a href="#">inherited</a> <sup>87</sup> to all objects underneath.
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to pause monitoring for a certain time span (days, hours) throughout the week. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

Schedules, Dependencies, and Maintenance Window	
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"><li>▪ <b>Use parent:</b> Pause the current object if its parent object is in a <b>Down</b> status, or if it is paused by another dependency.</li><li>▪ <b>Select object:</b> Pause the current object if its parent object is in a <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current object if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li></ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>159</sup> to choose an object on which the current object will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

Automatic Monitoring Data Analysis	
Unusual Detection	<p>Define if unusual detection is enabled for sensors. You can configure the behavior of unusual detection (or disable it completely) in the <a href="#">system settings</a><sup>[1839]</sup>.</p> <ul style="list-style-type: none"> <li>▪ <b>Enabled:</b> Enable unusual detection for this group. Sensors in this group will turn to orange color if unusual activity is detected.</li> <li>▪ <b>Disabled:</b> Disable unusual detection for this group. Unusual values will be ignored for sensors in this group; they will not show an unusual sensor status.</li> </ul>
Similar Sensors Detection	<p>Define if similar sensors detection is enabled for sensors. You can configure the depth of analysis of similar sensors detection (or disable it completely) in the <a href="#">system settings</a><sup>[1840]</sup>.</p> <ul style="list-style-type: none"> <li>▪ <b>Enabled:</b> Enable similar sensors detection for this group. Sensors in this group will be considered during similarity analysis.</li> <li>▪ <b>Disabled:</b> Disable similar detection for this group. Sensors in this group will not be taken into account during similarity analysis.</li> </ul>

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

## Notifications

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to you needs. In an object's detail page, click on the **Notifications** tab to change sensor notification triggers. The defined triggers will be inherited down to sensor level. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8 Sensor Settings

There are more than 210 different sensor types available. In the **Add Sensor** dialog, all sensors are categorized into groups to help you quickly find what you need. Once you are familiar with the interface, you will probably enter the first letters of a sensor type's name into the **Search** field in the upper left corner and get to a sensor even faster.

### Available Sensor Types

There is a dedicated manual section for every sensor type with details about the available settings. For more information, please see [List of Available Sensors](#)<sup>[291]</sup> section.

For sensor settings, there is also multi-edit available. This enables you to change properties of many sensors at a time. For more details, please see [Multi-Edit Lists](#)<sup>[1736]</sup> section.

In order to detect unexpected correlations between your network components, PRTG provides a [Similar Sensors](#)<sup>[138]</sup> analysis.

### Sensor Settings Overview

For information about sensor settings, please see the following sections:

- [Sensor Settings](#)<sup>[290]</sup>
- [List of Available Sensor Types](#)<sup>[291]</sup>
- [Additional Sensor Types \(Custom Sensors\)](#)<sup>[1706]</sup>
- [Sensor Channels Settings](#)<sup>[1709]</sup>
- [Sensor Notifications Settings](#)<sup>[1716]</sup>

## 6.8.1 List of Available Sensor Types

This chapter lists all available sensors, arranged both by different categories and in alphabetical order. **Note:** In the [Add a Sensor](#) <sup>220</sup> assistant, PRTG offers you various options to filter for fitting sensor types easily.

- [Common Sensors](#) <sup>291</sup>
  - [Bandwidth Monitoring Sensors](#) <sup>291</sup>
  - [Web Servers \(HTTP\) Sensors](#) <sup>292</sup>
  - [SNMP Sensors](#) <sup>293</sup>
  - [Windows WMI/Performance Counters Sensors](#) <sup>294</sup>
  - [Linux/Unix/OS X Sensors](#) <sup>296</sup>
  - [Virtual Servers Sensors](#) <sup>296</sup>
  - [Mail Servers Sensors](#) <sup>297</sup>
  - [SQL Database Servers Sensors](#) <sup>298</sup>
  - [File Servers Sensors](#) <sup>298</sup>
  - [Various Servers Sensors](#) <sup>298</sup>
  - [VoIP and QoS Sensors](#) <sup>299</sup>
  - [Hardware Parameters Sensors](#) <sup>299</sup>
  - [Custom Sensors](#) <sup>301</sup>
  - [PRTG Internal Sensors](#) <sup>301</sup>
  - [All Sensors in Alphabetical Order](#) <sup>301</sup>
  - [More](#) <sup>308</sup>
- 

### Common Sensors

- [HTTP Sensor](#) <sup>486</sup>
- [Ping Sensor](#) <sup>775</sup>
- [Port Sensor](#) <sup>804</sup>
- [Port Range Sensor](#) <sup>811</sup>
- [SNMP Traffic Sensor](#) <sup>1289</sup>
- [Windows Network Card Sensor](#) <sup>1478</sup>

### Bandwidth Monitoring Sensors

- [AVM FRITZ!Box WAN Interface Sensor](#) <sup>331</sup>

## Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

## 1 List of Available Sensor Types

- [IPFIX Sensor](#)  641
- [IPFIX \(Custom\) Sensor](#)  649
- [jFlow V5 Sensor](#)  664
- [jFlow V5 \(Custom\) Sensor](#)  672

## Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

## 1 List of Available Sensor Types

- [WMI SharePoint Process Sensor](#)  1663
- [Windows System Uptime Sensor](#)  1517
- [WMI Terminal Services \(Windows 2008\) Sensor](#)  1659
- [WMI Terminal Services \(Windows XP/Vista/2003\) Sensor](#)  1664
- [WMI UTC Time Sensor](#)  1660
- [WMI Vital System Data \(V2\) Sensor](#)  1674
- [WMI Volume Sensor](#)  1680
- [WMI Windows Version Sensor](#)  1693
- [WSUS Statistics Sensor](#)  1699

**Linux/Unix/OS X Sensors**

- [SNMP Linux Disk Free Sensor](#)  1122
- [SNMP Linux Load Average Sensor](#)  1130
- [SNMP Linux Meminfo Sensor](#)  1135
- [SNMP Linux Physical Disk Sensor](#)  1140
- [SSH Disk Free Sensor](#)  1286
- [SSH INodes Free Sensor](#)  1295
- [SSH Load Average Sensor](#)  1301
- [SSH Meminfo Sensor](#)  1307
- [SSH Remote Ping Sensor](#)  1313
- [SSH Script Sensor](#)  1341
- [SSH Script Advanced Sensor](#)  1360
- [SSH SAN Logical Disk Sensor](#)  1320
- [SSH SAN Physical Disk Sensor](#)  1327
- [SSH SAN System Health Sensor](#)  1334
- [WBEM Custom Sensor](#)  1426

**Virtual Servers Sensors**

- [Amazon CloudWatch Sensor](#)  323
- [Citrix XenServer Host Sensor](#)  343
- [Citrix XenServer Virtual Machine Sensor](#)  349
- [Enterprise Virtual Array Sensor](#)  382
- [Hyper-V Cluster Shared Volume Disk Free Sensor](#)  583

- [Hyper-V Host Server Sensor](#)  590
- [Hyper-V Virtual Machine Sensor](#)  596
- [Hyper-V Virtual Network Adapter Sensor](#)  604
- [Hyper-V Virtual Storage Device Sensor](#)  611
- [SCVMM Host Sensor](#)  842
- [SCVMM Virtual Machine Sensor](#)  849
- [SSH VMWare ESX\(i\) Disk Sensor](#)  1358
- [Virtuozzo Container Disk Sensor](#)  1389
- [Virtuozzo Container Network Sensor](#)  1395
- [VMware Host Hardware \(WBEM\) Sensor](#)  1401
- [VMware Host Hardware Status \(SOAP\) Sensor](#)  1407
- [VMware Host Performance \(SOAP\) Sensor](#)  1413
- [VMware Virtual Machine \(SOAP\) Sensor](#)  1419

## Mail Servers Sensors

- [Exchange Backup \(Powershell\) Sensor](#)  397
- [Exchange Database \(Powershell\) Sensor](#)  404
- [Exchange Mailbox \(Powershell\) Sensor](#)  411
- [Exchange Mail Queue \(Powershell\) Sensor](#)  418
- [Exchange Public Folder \(Powershell\) Sensor](#)  424
- [IMAP Sensor](#)  618
- [IP on DNS Blacklist Sensor](#)  635
- [POP3 Sensor](#)  792
- [POP3 Email Count Sensor](#)  798
- [SMTP Sensor](#)  905
- [SMTP&IMAP Round Trip Sensor](#)  911
- [SMTP&POP3 Round Trip Sensor](#)  919
- [WMI Exchange Server Sensor](#)  1553
- [WMI Exchange Transport Queue Sensor](#)  1560
- [Windows IIS 6.0 SMTP Received Sensor](#)  1436
- [Windows IIS 6.0 SMTP Sent Sensor](#)  1444

## SQL Database Servers Sensors

- [ADO SQL Sensor](#)  316
- [Microsoft SQL Sensor](#)  685
- [MySQL Sensor](#)  693
- [Oracle SQL Sensor](#)  732
- [WMI Microsoft SQL Server 2005 Sensor](#)  1596
- [WMI Microsoft SQL Server 2008 Sensor](#)  1607
- [WMI Microsoft SQL Server 2012 Sensor](#)  1615

## File Servers Sensors

- [Dell PowerVault MDi Sensor](#)  363
- [File Sensor](#)  449
- [File Content Sensor](#)  455
- [Folder Sensor](#)  461
- [FTP Sensor](#)  467
- [FTP Server File Count Sensor](#)  473
- [INI File Content Check Sensor](#)  629
- [SFTP Secure File Transfer Protocol Sensor](#)  887
- [Share Disk Free Sensor](#)  893
- [SNMP NetApp Disk Free Sensor](#)  1154
- [SNMP NetApp Enclosure Sensor](#)  1160
- [SNMP NetApp I/O Sensor](#)  1166
- [SNMP NetApp License Sensor](#)  1172
- [SNMP NetApp Network Interface Sensor](#)  1184
- [SNMP NetApp System Health Sensor](#)  1190
- [TFTP Sensor](#)  1377
- [WMI File Sensor](#)  1567
- [WMI Free Disk Space \(Multi Drive\) Sensor](#)  1573
- [WMI Volume Sensor](#)  1680

## Various Servers Sensors

- [DHCP Sensor](#)  369

- [DNS Sensor](#)  376
- [IPMI System Health Sensor](#)  657
- [LDAP Sensor](#)  680
- [Ping Sensor](#)  775
- [Ping Jitter Sensor](#)  781
- [Pingdom Sensor](#)  786
- [Port Sensor](#)  804
- [Port Range Sensor](#)  811
- [RADIUS Sensor](#)  832
- [RDP \(Remote Desktop\) Sensor](#)  837
- [SNMP Trap Receiver Sensor](#)  1267
- [SNTP Sensor](#)  1281
- [Syslog Receiver Sensor](#)  1364
- [Traceroute Hop Count Sensor](#)  1383

## VoIP and QoS Sensors

- [Cisco IP SLA Sensor](#)  337
- [SIP Options Ping Sensor](#)  899
- [QoS \(Quality of Service\) One Way Sensor](#)  820
- [QoS \(Quality of Service\) Round Trip Sensor](#)  826
- [SNMP Cisco CBOoS Sensor](#)  953

## Hardware Parameter Sensors

- [Dell PowerVault MDi Sensor](#)  363
- [Enterprise Virtual Array Sensor](#)  382
- [SNMP APC Hardware Sensor](#)  927
- [SNMP Cisco System Health Sensor](#)  958
- [SNMP Cisco UCS Chassis Sensor](#)  964
- [SNMP Cisco UCS Physical Disk Sensor](#)  970
- [SNMP Cisco UCS System Health Sensor](#)  976
- [SNMP CPU Load Sensor](#)  982
- [SNMP Dell Hardware Sensor](#)  1002
- [SNMP Dell PowerEdge Physical Disk Sensor](#)  1008

## Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

## 1 List of Available Sensor Types

- [SNMP Dell PowerEdge System Health Sensor](#) 
- [SNMP Disk Free Sensor](#) 
- [SNMP GSA System Health Sensor](#) 
- [SNMP Hardware Status Sensor](#) 
- [SNMP HP LaserJet Hardware Sensor](#) 
- [SNMP HP ProLiant Memory Controller Sensor](#) 
- [SNMP HP ProLiant Network Interface Sensor](#) 
- [SNMP HP ProLiant Physical Disk Sensor](#) 
- [SNMP HP ProLiant System Health Sensor](#) 
- [SNMP IBM System X Physical Disk Sensor](#) 
- [SNMP IBM System X Physical Memory Sensor](#) 
- [SNMP IBM System X System Health Sensor](#) 
- [SNMP LenovoEMC Physical Disk Sensor](#) 
- [SNMP LenovoEMC System Health Sensor](#) 
- [SNMP Library Sensor](#) 
- [SNMP Memory Sensor](#) 
- [SNMP NetApp I/O Sensor](#) 
- [SNMP NetApp Enclosure Sensor](#) 
- [SNMP NetApp Logical Unit Sensor](#) 
- [SNMP NetApp Network Interface Sensor](#) 
- [SNMP NetApp System Health Sensor](#) 
- [SNMP QNAP Physical Disk Sensor](#) 
- [SNMP QNAP System Health Sensor](#) 
- [SNMP SonicWALL System Health Sensor](#) 
- [SNMP SonicWALL VPN Traffic Sensor](#) 
- [SNMP Synology Physical Disk Sensor](#) 
- [SNMP Synology System Health Sensor](#) 
- [SSH SAN Logical Disk Sensor](#) 
- [SSH SAN Physical Disk Sensor](#) 
- [SSH SAN System Health Sensor](#) 
- [WMI HDD Health Sensor](#) 

## Custom Sensors

- [EXE/Script Sensor](#)  431
- [EXE/Script Advanced Sensor](#)  440
- [IPFIX \(Custom\) Sensor](#)  649
- [jFlow V5 \(Custom\) Sensor](#)  672
- [NetFlow V5 \(Custom\) Sensor](#)  708
- [NetFlow V9 \(Custom\) Sensor](#)  724
- [Packet Sniffer \(Custom\) Sensor](#)  748
- [Pingdom Sensor](#)  786
- [Sensor Factory Sensor](#)  856
- [sFlow \(Custom\) Sensor](#)  879
- [SNMP Custom Sensor](#)  987
- [SNMP Custom String Sensor](#)  994
- [SSH Script Sensor](#)  1341
- [WBEM Custom Sensor](#)  1426
- [WMI Custom Sensor](#)  1529
- [WMI Custom String Sensor](#)  1536

## PRTG Internal Sensors

- [Core Health Sensor](#)  359
- [Probe Health Sensor](#)  816
- [System Health Sensor](#)  1373

## All Sensors in Alphabetical Order

The version numbers show when the respective sensor type was originally introduced to PRTG.

- [Active Directory Replication Errors Sensor](#)  309 (v8.3.0)
- [ADO SQL Sensor](#)  316 (v8.1.0)
- [Amazon CloudWatch Sensor](#)  323 (v7)
- [AVM FRITZ!Box WAN Interface Sensor](#)  331 (v12.x.1)
- [Cisco IP SLA Sensor](#)  337 (v7)
- [Citrix XenServer Host Sensor](#)  343 (v12.x.1)

## Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

## 1 List of Available Sensor Types

- [Citrix XenServer Virtual Machine Sensor](#)<sup>[349]</sup> (v8.1.0)
- [Cluster Probe Health Sensor](#)<sup>[355]</sup> (v9.1.0)
- [Core Health Sensor](#)<sup>[359]</sup> (v9.1.0)
- [Dell PowerVault MDi Sensor](#)<sup>[363]</sup> (v12.x.1)
- [DHCP Sensor](#)<sup>[369]</sup> (v8.2.0)
- [DNS Sensor](#)<sup>[376]</sup> (v7)
- [Enterprise Virtual Array Sensor](#)<sup>[382]</sup> (v13.x.6)
- [Event Log \(Windows API\) Sensor](#)<sup>[389]</sup> (v7)
- [Exchange Backup \(Powershell\) Sensor](#)<sup>[397]</sup> (v13.x.5)
- [Exchange Database \(Powershell\) Sensor](#)<sup>[404]</sup> (v13.x.5)
- [Exchange Mailbox \(Powershell\) Sensor](#)<sup>[411]</sup> (v13.x.5)
- [Exchange Mail Queue \(Powershell\) Sensor](#)<sup>[418]</sup> (v13.x.5)
- [Exchange Public Folder \(Powershell\) Sensor](#)<sup>[424]</sup> (v13.x.5)
- [EXE/Script Sensor](#)<sup>[431]</sup> (v7)
- [EXE/Script Advanced Sensor](#)<sup>[440]</sup> (v7)
- [File Sensor](#)<sup>[449]</sup> (v7)
- [File Content Sensor](#)<sup>[455]</sup> (v7)
- [Folder Sensor](#)<sup>[461]</sup> (v7)
- [FTP Sensor](#)<sup>[467]</sup> (v7)
- [FTP Server File Count Sensor](#)<sup>[473]</sup> (v8.3.0)
- [Google Analytics Sensor](#)<sup>[479]</sup> (v12.x.1)
- [HTTP Sensor](#)<sup>[486]</sup> (v7)
- [HTTP Advanced Sensor](#)<sup>[493]</sup> (v7)
- [HTTP Apache ModStatus PerfStats Sensor](#)<sup>[505]</sup> (v12.x.3)
- [HTTP Apache ModStatus Totals Sensor](#)<sup>[512]</sup> (v12.x.3)
- [HTTP Content Sensor](#)<sup>[519]</sup> (v7)
- [HTTP Full Web Page Sensor](#)<sup>[528]</sup> (v7)
- [HTTP Push Count Sensor](#)<sup>[536]</sup> (v13.4.8)
- [HTTP Push Data Sensor](#)<sup>[542]</sup> (v14.1.9)
- [HTTP Push Data Advanced Sensor](#)<sup>[549]</sup> (14.1.10)
- [HTTP SSL Certificate Expiry Sensor](#)<sup>[556]</sup> (v8.3.0)
- [HTTP Transaction Sensor](#)<sup>[562]</sup> (v7)
- [HTTP XML/REST Value Sensor](#)<sup>[572]</sup> (v8.3.0)
- [Hyper-V Cluster Shared Volume Disk Free Sensor](#)<sup>[583]</sup> (v12.3.4)

- [Hyper-V Host Server Sensor](#)<sup>[590]</sup> (v7)
- [Hyper-V Virtual Machine Sensor](#)<sup>[596]</sup> (v7)
- [Hyper-V Virtual Network Adapter Sensor](#)<sup>[604]</sup> (v9.1.0)
- [Hyper-V Virtual Storage Device Sensor](#)<sup>[611]</sup> (v12.4.4)
- [IMAP Sensor](#)<sup>[618]</sup> (v7)
- [INI File Content Check Sensor](#)<sup>[629]</sup> (v8.3.0)
- [IP on DNS Blacklist Sensor](#)<sup>[635]</sup> (v8.3.0)
- [IPFIX Sensor](#)<sup>[641]</sup> (v13.x.7)
- [IPFIX \(Custom\) Sensor](#)<sup>[649]</sup> (v13.x.7)
- [IPMI System Health Sensor](#)<sup>[657]</sup> (v14.x.11)
- [jFlow V5 Sensor](#)<sup>[664]</sup> (v8.2.0)
- [jFlow V5 \(Custom\) Sensor](#)<sup>[672]</sup> (v8.2.0)
- [LDAP Sensor](#)<sup>[680]</sup> (v8.1.0)
- [Microsoft SQL Sensor](#)<sup>[685]</sup> (v7)
- [MySQL Sensor](#)<sup>[693]</sup> (v7)
- [NetFlow V5 Sensor](#)<sup>[700]</sup> (v7)
- [NetFlow V5 \(Custom\) Sensor](#)<sup>[708]</sup> (v7)
- [NetFlow V9 Sensor](#)<sup>[716]</sup> (v7)
- [NetFlow V9 \(Custom\) Sensor](#)<sup>[724]</sup> (v7)
- [Oracle SQL Sensor](#)<sup>[732]</sup> (v7)
- [Packet Sniffer Sensor](#)<sup>[740]</sup> (v7)
- [Packet Sniffer \(Custom\) Sensor](#)<sup>[748]</sup> (v7)
- [Passive Application Performance Sensor](#)<sup>[755]</sup> (v13.x.4)
- [PerfCounter Custom Sensor](#)<sup>[761]</sup> (v12.x.3)
- [PerfCounter IIS Application Pool Sensor](#)<sup>[768]</sup> (v12.x.6)
- [Ping Sensor](#)<sup>[775]</sup> (v7)
- [Ping Jitter Sensor](#)<sup>[781]</sup> (v8.3.0)
- [Pingdom Sensor](#)<sup>[786]</sup> (v8.4.0)
- [POP3 Sensor](#)<sup>[792]</sup> (v7)
- [POP3 Email Count Sensor](#)<sup>[798]</sup> (v8.3.0)
- [Port Sensor](#)<sup>[804]</sup> (v7)
- [Port Range Sensor](#)<sup>[811]</sup> (v12.x.4)
- [Probe Health Sensor](#)<sup>[816]</sup> (v9.1.0)
- [QoS \(Quality of Service\) One Way Sensor](#)<sup>[820]</sup> (v7)

## Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

## 1 List of Available Sensor Types

- [OoS \(Quality of Service\) Round Trip Sensor](#)<sup>[826]</sup> (v9.1.0)
- [RADIUS Sensor](#)<sup>[832]</sup> (v7)
- [RDP \(Remote Desktop\) Sensor](#)<sup>[837]</sup> (v7)
- [SCVMM Host Sensor](#)<sup>[842]</sup> (v12.x.6)
- [SCVMM Virtual Machine Sensor](#)<sup>[849]</sup> (v12.x.6)
- [Sensor Factory Sensor](#)<sup>[856]</sup> (v7)
- [sFlow Sensor](#)<sup>[871]</sup> (v7)

## More

Did not find what you are looking for? Have a look into the [Additional Sensor Types \(Custom Sensors\)](#)  section.

## 6.8.2 Active Directory Replication Errors Sensor

The Active Directory Replication Errors sensor uses its parent device's Windows credentials to check domain controllers for replication errors. It can show the number of consecutive sync failures, if the source is deleted, if the scheduled sync is disabled, when the last sync attempt took place, the result of the last sync, when there was the last sync success, the number of modified consecutive sync failures, and the number of pending replication operations.

Please make sure you enter valid domain credentials in the parent device's settings.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>[2039]</sup>.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

### Requirement: Member of Windows Domain

This sensor only works if the computer running the PRTG probe is part of the domain whose AD should be monitored. The probe runs either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If this requirement is not met, the sensor will fail.

### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

**Note:** Your Windows credentials may not contain any double quotation marks ("). If they do, this sensor will not work!

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor replications, PRTG will create one sensor for each replication neighbor you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
Replication Neighbor	Select the replication neighbor whose replication you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Sensor Settings**

Replication Neighbor	Shows the replication neighbor whose replication this sensor monitors. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
----------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval**

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.3 ADO SQL Sensor

The ADO SQL sensor monitors a database using an ActiveX Data Objects (ADO) connection. It connects to the server and shows the response time. Additionally, it can read the number of records and a value.

**Note:** For security reasons, you can only create a sensor on a device for which Windows Credentials have been defined. With these credentials, the PRTG probe must be able to connect to the Windows domain. If you don't enter valid credentials, you will get an **Access denied** error message when scanning. For detailed information, please see [More](#)<sup>[322]</sup> section below.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

ADO Specific Data	
Connection String	Enter the string that will be used to connect to the database. For example, such a string could be: <b>Provider=SQLOLEDB.1;Data Source=10.0.0.200\SQLEXPRESS;User ID=user;Password=userpass;Initial Catalog=Northwind</b> . For more information on how to build connection strings, please see <a href="#">More</a> <small>322</small> section below.
Data	
SQL Expression	Enter a valid SQL statement to execute on the server. In your SELECT statement, please specify the field name explicitly. Do <b>not</b> use <b>SELECT *</b> ! For example, a correct expression could be: <b>SELECT AVG(UnitPrice) FROM Products</b> . When a cursor is returned (i.e. with a SELECT statement), only the first row of data will be processed.
Record Count	<p>If you want to know how many records in your database were affected by your SQL expression as defined above, you can count the number of concerned records. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Do not count number of records:</b> Affected records will not be counted.</li> <li>▪ <b>Count number of records:</b> The number of affected records will be counted. <b>Note:</b> Enabling this option might increase the execution time of this sensor.</li> </ul>
Post-Processing	<p>If the SQL expression returns a result set, please define if you want to further process it. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore result set:</b> Do not do anything with the data returned.</li> <li>▪ <b>Process numerical result:</b> Regard the result set returned as integer or float. You can set the sensor to <b>Warning</b> or <b>Down</b> status for specific thresholds. Define below.</li> <li>▪ <b>Process string result:</b> Regard the result set returned as a string. You can set the sensor to error for certain sub-strings contained or missing. Define below.</li> <li>▪ <b>Monitor for changes:</b> Monitor if the result set has changed since last check. The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <small>1716</small> whenever a sensor value changes.</li> </ul>
Condition "Warning"	This field is only visible if numeric results is enabled above. Define a condition of the returned numeric SQL result set that will set the sensor to a <b>Warning</b> status. Choose between:

## Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

## 3 ADO SQL Sensor

	<ul style="list-style-type: none"> <li>▪ <b>none:</b> Do not set the sensor to <b>Warning</b> status for any condition.</li> <li>▪ <b>equals:</b> Result set must be the same as the value provided below.</li> <li>▪ <b>is above:</b> Result set must be above the value provided below.</li> <li>▪ <b>lower than:</b> Result set must be below the value provided below.</li> <li>▪ <b>does not equal:</b> Result set must be unequal to the value provided below.</li> </ul> <p><b>Note:</b> This threshold check the SQL result set only. You can set additional thresholds in the sensor's <a href="#">channel settings</a> <small>1709</small>.</p>
Value	This field is only visible if numeric results is enabled above. Enter a value of the returned numeric SQL result set that will set the sensor into a <b>Warning</b> status. Please enter an integer or float value.
Condition "Down"	<p>This field is only visible if numeric results is enabled above. Define a condition of the returned numeric SQL result set that will set the sensor to a <b>Down</b> status. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>none:</b> Do not set the sensor to <b>Down</b> status for any condition.</li> <li>▪ <b>equals:</b> Result set must be the same as the value provided below.</li> <li>▪ <b>is above:</b> Result set must be above the value provided below.</li> <li>▪ <b>lower than:</b> Result set must be below the value provided below.</li> <li>▪ <b>does not equal:</b> Result set must be unequal to the value provided below.</li> </ul> <p><b>Note:</b> This threshold check the SQL result set only. You can set additional thresholds in the sensor's <a href="#">channel settings</a> <small>1709</small>.</p>
Value	This field is only visible if numeric results is enabled above. Enter a value of the returned numeric SQL result set that will set the sensor to a <b>Down</b> status. Please enter an integer value.
Response Must Include	This field is only visible if string results is enabled above. Enter a string that must be part of the returned SQL string. If it is not, the sensor will be set to an error state. Please enter a string or leave the field empty.
Response Must Not include	This field is only visible if string results is enabled above. Enter a string that must not be part of the returned SQL string. If it is, the sensor will be set to an error state. Please enter a string or leave the field empty.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <small>1817</small> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

**Access Rights**

User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>
-------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.4 Amazon CloudWatch Sensor

The Amazon CloudWatch sensor monitors performance of Amazon Cloud services, such as Elastic Compute Cloud (EC2), Simple Queue Service (SQS), Elastic Load Balancing (ELB), Elastic Block Store (EBS), Simple Notification Service (SNS), Relational Database Service (RDS), and ElastiCache.

Depending on the selected service, the sensor can show CPU utilization, network load in and out, and disk read and write speed.

**Note:** The CloudWatch option must be enabled for the instance you want to monitor (you can do this, for example, using Amazon's AWS console). Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. Depending on the service, each Amazon CloudWatch sensor sends about 10 to 30 requests with each scanning interval. Last time we checked the Amazon price list, they charged max. US\$ 0.014 per 1,000 requests (depending on your region). Please see [More](#)<sup>[329]</sup> section for detailed information.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page:

Amazon Credentials	
Region	<p>Select the region in which the instance to be monitored is running. The settings you make in this dialog are valid for all of the sensors that are created. Choose between:</p> <ul style="list-style-type: none"><li>▪ <b>US East (Northern Virginia)</b></li><li>▪ <b>US West (Oregon)</b></li><li>▪ <b>US West (Northern California)</b></li><li>▪ <b>EU (Ireland)</b></li><li>▪ <b>Asia Pacific (Singapore)</b></li><li>▪ <b>Asia Pacific (Tokyo)</b></li><li>▪ <b>Asia Pacific (Sydney)</b></li><li>▪ <b>South America (Sao Paulo)</b></li></ul> <p><b>Note:</b> The CloudWatch option must be enabled for the instance you want to monitor (you can do this e.g. using Amazon's AWS console).</p>

Select which service instances you want to monitor. PRTG will create one sensor for each instance you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Amazon CloudWatch Specific	
Service Instance	<p>Select the instances you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.</p>

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings**

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Amazon Credentials**

AWS Access Key ID	Enter your access key. You can obtain it from <a href="https://aws.amazon.com">aws.amazon.com</a> .
AWS Secret Access Key	Enter your secret access key. You can obtain it from <a href="https://aws.amazon.com">aws.amazon.com</a> .
Region	Shows the region your instance is located at. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

**Amazon CloudWatch Specific**

Period (Interval)	<p>Define in what granularity you want to receive datapoints from CloudWatch. Choose between:</p> <ul style="list-style-type: none"> <li>▪ 1 Minute</li> <li>▪ 2 Minutes</li> <li>▪ 5 Minutes</li> <li>▪ 10 Minutes</li> <li>▪ 30 Minutes</li> <li>▪ 1 Hour</li> </ul>
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings  
4 Amazon CloudWatch Sensor

Amazon CloudWatch Specific	
Service	Shows the service this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Instance	Shows the Instance ID of the Amazon Web Services instance this sensor is monitoring. When using the "Simple Notification Service (SNS)" service, this field is not visible. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Topic Name	This field is only visible if you selected a "Simple Notification Service (SNS)" instance before. It shows the topic name that is monitored by this sensor. The sensor will show the number and size of messages published, and the number of notifications delivered and failed. Each sensor can monitor one topic name only. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Availability Zone	This field is only visible if you selected a "Elastic Load Balancing (ELB)" instance before. Enter the name of the Availability Zone of your Load Balancer you want to monitor. If you leave this field empty, the average value of all zones will be taken.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <small>1709</small> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Note:** For Amazon CloudWatch sensors, the scanning interval cannot be inherited. Please use the individual settings of the sensor to define the interval in which data is received.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

**Maintenance Begins At**

This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.5 AVM FRITZ!Box WAN Interface Sensor

The AVM FRITZ!Box WAN Interface Sensor monitors the internet traffic of a FRITZ!Box internet access router from European manufacturer AVM. It returns the incoming and outgoing internet traffic.

**Note:** There are no credentials necessary, but transmission of status information via Universal Plug and Play (UPnP) must be enabled in the network settings of your FRITZ!Box. See [More](#)<sup>[335]</sup> section below for detailed information.

**Note:** This sensor type might not support FRITZ!Boxes with firmware of **Kabel Deutschland**. Also, it might only support FRITZ!Boxes until operating system version 6.03. See section [More](#)<sup>[335]</sup> below for details.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 2.0.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
-------------	-------------------------------------------------------------------------------------------------------------------------

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <a href="#">Vertical Axis Scaling</a> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>[224]</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.6 Cisco IP SLA Sensor

The Cisco IP SLA sensor monitors Voice over IP (VoIP) network parameters using IP Service Level Agreement (SLA) from Cisco via Simple Network Management Protocol (SNMP). It shows different aspects provided by the queried device.

For a general introduction to the technology behind Quality of Service monitoring, please see [Monitoring Quality of Service](#)<sup>[197]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

IP SLA Specific	
IP SLAs	<p>Select the IP SLAs you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head. The list options depend on the configuration of the queried device. If you're missing a type here, please check your device's configuration. PRTG can support the following operations:</p> <ul style="list-style-type: none"><li>▪ <b>echo</b></li><li>▪ <b>pathEcho</b></li><li>▪ <b>fileIO</b></li><li>▪ <b>script</b></li><li>▪ <b>udpEcho</b></li><li>▪ <b>tcpConnect</b></li><li>▪ <b>http</b></li><li>▪ <b>dns</b></li><li>▪ <b>jitter</b></li><li>▪ <b>dls</b></li><li>▪ <b>dhcp</b></li><li>▪ <b>ftp</b></li><li>▪ <b>path-jitter</b></li></ul>

**IP SLA Specific**

**Note:** Packet Loss values are summarized, but have no explicit channel for Source—Destination or Destination—Source values

**Sensor Settings**

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings**

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**IP SLA Specific**

ID	These fields show SLA specific settings provided by the queried SLA device. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Type	
Name (Tag)	
Owner	
Frequency	

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <small>1817</small>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.7 Citrix XenServer Host Sensor

The Citrix XenServer Host Sensor monitors a Xen host server via Hypertext Transfer Protocol (HTTP). It shows CPU, memory, and network usage, as well as the number of running virtual machines and load average.

**Note:** The parent device must be a Citrix XenServer (version 5.0 or later).

For this sensor type credentials for Xen servers must be defined for the device you want to use the sensor on.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>2050</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

### Monitoring a XenServer Pool

In a XenServer pool there is one "pool master" that manages the pool. Incoming queries on any host are automatically forwarded to the pool master. If you want to monitor your virtual machines, or host servers, simply create respective sensors on a device that represents **one** host server of your pool. Internal processes will make sure that monitoring will take place and continue independently from the physical host. **Note:** In PRTG's device tree, the sensors for virtual machines will always remain on the host you originally created it on, also if it is currently running on a different host.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

If you select more than one host, multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

**Host Settings**

Host	Select the hosts you want to add a sensor for, including the ones that are not running. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.
------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Settings**

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings**

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Host Settings**

UUID	Shows the Universally Unique Identifier (UUID) of the host monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the host monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## 6.8.8 Citrix XenServer Virtual Machine Sensor

The Citrix XenServer Virtual Machine Sensor monitors a virtual machine on a Xen server via Hypertext Transfer Protocol (HTTP). It shows CPU usage and free memory in percent.

**Note:** The parent device must be a Citrix XenServer (version 5.0 or later).

For this sensor type credentials for Xen servers must be defined for the device you want to use the sensor on.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>2050</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

### Monitoring a XenServer Pool

In a XenServer pool there is one "pool master" that manages the pool. Incoming queries on any host are automatically forwarded to the pool master. If you want to monitor your virtual machines, or host servers, simply create respective sensors on a device that represents **one** host server of your pool. Internal processes will make sure that monitoring will take place and continue independently from the physical host. **Note:** In PRTG's device tree, the sensors for virtual machines will always remain on the host you originally created it on, also if it is currently running on a different host.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

**Note:** PRTG requests a full list of all virtual machines configured on the device. Therefore, it may take a few seconds before the dialog is loaded.

If you select more than one virtual machine, multiple sensors are created at once in the **Add Sensor** dialog. The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

### Virtual Machine Settings

Virtual Machine	Select the Virtual Machine (VM) you want to add a sensor for, including the ones that are not running. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.
-----------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### Virtual Machine Settings

UUID	Shows the Universally Unique Identifier (UUID) of the virtual machine. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the virtual machine. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <small>1817</small>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.9 Cluster Probe Health Sensor

The Cluster Probe Health sensor is a system device indicating PRTG's own system health status. It is created automatically with a PRTG cluster installation and cannot be deleted. It measures various internal system parameters of the cluster system and the probe's internal processes and then computes a resulting value. Frequent or repeated health values below 100 % should be investigated, please check the sensor's channels for details.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"><li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li></ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.10 Core Health Sensor

The Core Health sensor monitors internal PRTG parameters. It shows the state of the PRTG core server. It is created automatically by PRTG and cannot be deleted. This sensor type checks various parameters of your PRTG core which have an impact on the stability of the system:

- **Health:** This index value sums up the core state into a value between 100% (healthy) and 0% (failing). Frequent or repeated health values below 100% should be investigated.
- **CPU Load:** This channel shows the current percentage CPU load. Extensive CPU load can lead to false, incomplete, and incorrect monitoring results. This value usually should stay below 50%.
- **Handles:** This is a counter for the data structures of the operating system. It is responsible for internal resource management. Repeated obviously increasing values should be investigated.
- **Committed Memory:** This channel shows the amount of memory committed to the PRTG core server as reported by the memory manager.
- **Free Page File Memory:** This channel shows the amount of free page file memory currently available on the system. Page file memory is aggregated RAM and the size of page file. It is the maximum amount of memory that is available on the system to be used for all currently running processes. If it gets too low the system can crash, at least some applications will throw "Out of memory" errors.
- **Free Physical Memory:** This channel shows the amount of free physical memory currently available on the system. This is the RAM that is physically built-in in the computer. If it gets too low the system will become very slow and PRTG is not usable in a reasonable way anymore. It can happen that some sensors will not be displayed correctly in that case, they will appear disabled (grayed out).
- **Free Virtual Memory:** This channel shows the accessible address space on the system for PRTG. PRTG cannot use more memory than reported here, independently from free page file and physical memory. On a 32bit OS (operating system) the maximum is 2 GB (3 GB with special settings under Windows); on a 64bit OS it is 4 GB if PRTG is running as 32bit version, and unlimited as 64bit version (only Core). If free virtual memory gets too low, PRTG will throw "Out of memory" errors or the message "not enough storage to process this command" (visible in the Core log).
- **Threads:** This channel shows the number of program parts which are currently running simultaneously. This number can increase with heavy load. The number should not exceed 100 in normal operation.

This sensor can be set up on a Probe Device only!

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[170]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

#### Scanning Interval

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>94</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.11 Dell PowerVault MDi Sensor

The Dell PowerVault MDi sensor monitors a virtual disk on a Dell PowerVault MD3000i, MD3620i, MD3000f, or MD3620f. It may work with additional models, too. This sensor can show current, maximum, and total IOs, current and maximum speed, as well as read and cache hit percentages.

#### Requirement: Dell Modular Disk Storage Manager

This sensor requires an installation of Dell's "Modular Disk Storage Manager" program. This has to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. For details about setup, please see [More](#)<sup>[367]</sup> section below.

**Note:** Please create this sensor on a device which has the SAN's IP address configured in the "IP address/DNS name" field.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

If you select more than one disk, multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
Virtual Disks	Select the disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
Virtual Disk	Shows the name of the virtual disk monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[170]</sup> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>941</sup>.</p>

## More

Where do I find the Dell PowerVault Modular Disk Storage Manager for use with my MDi SAN?

- <http://kb.paessler.com/en/topic/38743>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.12 DHCP Sensor

The DHCP sensor monitors a Dynamic Host Configuration Protocol (DHCP) server. It sends a broadcast message to the network and waits for a DHCP server to respond. If a server responds, the sensor shows both the address of the server and the offered IP in the sensor's **Message** field. You can check the server's response using [Regular Expressions](#)<sup>[2048]</sup>. The sensor's channels include response time (msec) and the lease time given by the server (in days).

This sensor can be set up on a Probe Device only! On sensor creation, choose the network card on the probe system which will be used to send the broadcast message.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor DHCP servers, PRTG will create one sensor for each network interface you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### DHCP Specific

Specify Network Interface

Select the network adapters you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name

Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

DHCP Specific	
MAC	Shows the MAC address of the network adapter that is used to send the broadcast message to the network. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Client IP	Specify if you want to check the returned client IP with a regular expression. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Don't check:</b> The IP will only appear in the sensor message without further processes.</li> <li>▪ <b>Check:</b> Enter the regular expression you want to use below.</li> </ul>
Client IP Must Include	This field will only appear if you chose to check the client IP above. In the response of the DHCP server, search using a regular expression. If the answer for the client IP <b>does not contain</b> the defined string, the sensor will change to a <b>Down</b> status. For example, enter <b>10\0\5\.*</b> to make sure any answering DHCP server returns an client IP address starting with "10.0.5.". If it doesn't, the sensor will show an error. For more details, see <a href="#">Regular Expressions</a> <sup>[2048]</sup> section. Leave empty to not use this field.
Client IP Must Not Include	This field will only appear if you chose to check the client IP above. In the response of the DHCP server, search using a regular expression. If the answer for the client IP <b>contains</b> the defined string, the sensor will change to a <b>Down</b> status. See example above. For more details, see <a href="#">Regular Expressions</a> <sup>[2048]</sup> section. Leave empty to not use this field.
Server IP	Specify if you want to check the returned server IP with a regular expression. Choose between:

DHCP Specific	
	<ul style="list-style-type: none"> <li>▪ <b>Don't check:</b> The IP will only appear in the sensor message without further processes.</li> <li>▪ <b>Check:</b> Enter the regular expression you want to use below.</li> </ul>
Server IP Must Include	This field will only appear if you chose to check the server IP above. In the response of the DHCP server, search using a regular expression. If the answer for the server IP <b>does not contain</b> the defined string, the sensor will change to a <b>Down</b> status. See example above. For more details, see <a href="#">Regular Expressions</a> <sup>[2048]</sup> section. Leave empty to not use this field.
Server IP Must Not Include	This field will only appear if you chose to check the server IP above. In the response of the DHCP server, search using a regular expression. If the answer for the server IP <b>contains</b> the defined string, the sensor will change to a <b>Down</b> status. See example above. For more details, see <a href="#">Regular Expressions</a> <sup>[2048]</sup> section. Leave empty to not use this field.
Timeout (sec)	Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered.
DHCP Server Change	<p>If there is more than one DHCP server in the network that may answer to the broadcast message, the sensor can receive an answer from a different DHCP server, compared to the last scan of the sensor. In this case, PRTG can write an entry to the system <a href="#">Logs</a><sup>[147]</sup>. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore:</b> Do not write a log entry if the DHCP server changes.</li> <li>▪ <b>Write log entry:</b> Write an entry to the system <b>Logs</b> whenever the DHCP server changes between two sensor scans.</li> </ul> <p><b>Note:</b> Regardless of this setting, those entries will always be added to the sensor <b>Log</b>.</p>
Offered IP Change	<p>If the IP address offered by the DHCP server changes between two sensor scans, PRTG can write an entry to the system <a href="#">Logs</a><sup>[147]</sup>. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore:</b> Do not write a log entry if the offered IP address changes.</li> <li>▪ <b>Write log entry:</b> Write an entry to the system <b>Logs</b> whenever the DHCP server offers a different IP address compared to the last sensor scan.</li> </ul> <p><b>Note:</b> Regardless of this setting, those entries will always be added to the sensor <b>Log</b>.</p>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.13 DNS Sensor

The DNS sensor monitors a Domain Name Service (DNS) server. It resolves a domain name and compares it to a given IP address. The sensor shows the response time and goes to an error state if the DNS server does not resolve a given domain name correctly.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

DNS Specific	
Timeout (sec)	Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered.

DNS Specific	
Port	Enter the number of the port the sensor will try to connect to. This must be the port the sensor's parent device is running the DNS service on. Usually you will use port 53. We recommend using the default value. <b>Note:</b> The sensor will connect to the <b>IP Address</b> or <b>DNS Name</b> value of the device it is created on.
Domain	Enter the domain name that will be resolved by the sensor using the Domain Name Service (DNS) server specified in the sensor's parent device's settings. You can enter an internet domain name here (for example, <b>example.com</b> ), or a DNS name in your internal network (such as <b>computer-xyz</b> ); depending on the type of DNS server you will monitor. You can also enter an IP address here.
Query Type	<p>Select the type of query that should be sent to the DNS server. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Host address IPv4 (A)</b></li> <li>▪ <b>Host address IPv6 (AAAA)</b></li> <li>▪ <b>Authoritative name server (NS)</b></li> <li>▪ <b>Start of a zone of authority marker (SOA)</b></li> <li>▪ <b>Domain name pointer (PTR)</b></li> <li>▪ <b>Mail exchange (MX)</b></li> <li>▪ <b>Canonical name for an alias (CNAME)</b></li> </ul>
Check Result	<p>Define if the result received from the DNS server will be checked. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore result:</b> Any valid answer of the DNS server will be accepted by the sensor.</li> <li>▪ <b>Check result:</b> Check if the response contains certain strings. Define below.</li> </ul>
Value	This field is only visible if result checking is enabled above. Enter elements that must be contained in the response of the DNS server. Enter each entry in one line. At least one of the elements must be contained in the received result. If none of the element matches the response, the sensor will show a red <b>Down</b> status. For example, you can enter an IP address here if your <b>Domain</b> field contains a host name. Only if the host name is resolved to the correct IP address your sensor will show a green <b>Up</b> status.
Write Result	<p>Define what will be done with the results the sensor receives. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> </ul>

DNS Specific	
	<ul style="list-style-type: none"> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor (ID).txt"):</b> Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>[2074]</sup> section.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>[224]</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.14 Enterprise Virtual Array Sensor

The Enterprise Virtual Array sensor monitors an HP StorageWorks Enterprise Virtual Array (EVA) using the `ssu.exe` from **HP Command View EVA Software**. It can show the status of several EVA modules, for example, status of system, controllers, enclosures, disks, disk groups, folders, hosts, snapshots, data replication, cabinets, and many more, depending on the available measurement components. If devices have measuring tools for fans and temperature, the corresponding data will be displayed as well.

For these EVA components, this sensor type can show the operational status, predicted failures, accessible media, allocation in percent, availability for VRaids in bytes, exaggerated bytes, group host access, the number of grouped and ungrouped disks, the age of snapshots, and the license status.

**Note:** You have to explicitly specify the credentials of the EVA in the sensor settings.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>2039</sup>.

**Important notice:** Currently, this sensor type is in **beta** status. The methods of operating can change at any time, as well as the available settings. **Do not expect** that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

#### Requirement: Command View

The EVA sensor needs the HP Command View EVA Software to be installed on the probe system. If you do not want to install the whole command view tool, you can alternatively use another approach. For details, please see section [More](#)<sup>387</sup>.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page:

EVA Credentials	
Scanning Mode	<p>Specify the depth of the meta scan. Choose between:</p> <ul style="list-style-type: none"><li>▪ <b>Basic:</b> We recommend using this scanning mode. Various modules of your EVA will be available for monitoring.</li></ul>

**EVA Credentials**

- **Full Detail:** PRTG will scan for each disk of your EVA. Every disk will be listed in the module selection.

Select which modules you want to monitor. PRTG will create one sensor for each module you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

**EVA Settings****Modules**

Select the modules you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

**Sensor Settings**

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings****Sensor Name**

Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

**Tags**

Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. Those are not visible here.

**Priority**

Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

EVA Credentials	
Username	Enter the username for the EVA.
Password	Enter the password for the EVA.

EVA Settings	
Module	Shows the monitored module. You can adjust this setting if the module was renamed or moved to another folder. This way, PRTG can find the module again and the monitoring history will not be lost.
System	Shows further information about the monitored module. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Module Type	
Description	
Sensor Result	<p>Define what will be done with the results the sensor receives. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>
Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.15 Event Log (Windows API) Sensor

The Event Log (Windows API) sensor monitors Event Log entries using Windows Application Programming Interface (API). It shows the number of new records per second (speed).

You can set the sensor to a desired status individually according to a new event log entry. For details and how to find out the correct filter, see section [More](#)<sup>[395]</sup>.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### Windows API Event Log Specific

Log File	<p>Specify the log file the sensor will monitor. The Windows event log provides several different log files which are shown below. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Application</b></li> <li>▪ <b>System</b></li> <li>▪ <b>Security</b></li> <li>▪ <b>Directory Service</b></li> <li>▪ <b>DNS Server</b></li> <li>▪ <b>File Replication Service</b></li> </ul>
----------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Filter Event Log Entries

Event Type	<p>Specify the type of event that will be considered by this sensor. Other event type will not be processed. Choose between the following event types:</p> <ul style="list-style-type: none"> <li>▪ <b>Any</b></li> <li>▪ <b>Error</b></li> <li>▪ <b>Warning</b></li> <li>▪ <b>Information</b></li> <li>▪ <b>Security Audit Success</b></li> <li>▪ <b>Security Audit Failure</b></li> </ul>
Filter by Source	<p>Filter all received events for a certain event source. If enabled, only messages matching the defined value will be considered by the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Off:</b> Do not filter by event source.</li> <li>• <b>On:</b> Enable filtering by event source.</li> </ul>
Match String (Event Source)	<p>This field is only visible if filtering is enabled above. Enter a source from which the events are to come from. Only events from a source matching this string will be regarded, others ignored. Please enter a string.</p>
Filter by ID	<p>Filter all received events for a certain event ID. If enabled, only messages matching the defined value(s) will be considered by the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Off:</b> Do not filter by event ID.</li> </ul>

Filter Event Log Entries	
	<ul style="list-style-type: none"> <li>• <b>On:</b> Enable filtering by event ID.</li> </ul>
Match Value (Event ID)	This field is only visible if filtering is enabled above. Enter one or more event IDs (comma separated) from which the events are to come from. Only events with an ID matching one of the values will be regarded. Please enter one integer value or more comma separated integer values.
Filter by Category	<p>Filter all received events for a certain event category. If enabled, only messages matching the defined value will be considered by the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Off:</b> Do not filter by event category.</li> <li>• <b>On:</b> Enable filtering by event category.</li> </ul>
Match String (Event Category)	This field is only visible if filtering is enabled above. Enter a category which the events are to have. Only events with a category matching this string will be regarded. Please enter a string.
Filter by Event User	<p>Filter all received events for a certain event user. If enabled, only messages matching the defined value will be considered by the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Off:</b> Do not filter by event user.</li> <li>• <b>On:</b> Enable filtering by event user.</li> </ul>
Match String (Event User)	This field is only visible if filtering is enabled above. Enter a user name which the event are to be assigned to. Only events with a user name matching this string will be regarded. Please enter a string.
Filter by Event Computer	<p>Filter all received events for a certain event computer. If enabled, only messages matching the defined value will be considered by the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Off:</b> Do not filter by event computer.</li> <li>• <b>On:</b> Enable filtering by event computer.</li> </ul>
Match String (Event Computer)	This field is only visible if filtering is enabled above. Enter a computer name which the events are to be assigned to. Only events with a computer name matching this string will be regarded. Please enter a string.
Filter by Event Message	Filter all received events for a certain event message. If enabled, only messages matching the defined value will be considered by the sensor. Choose between:

Filter Event Log Entries	
	<ul style="list-style-type: none"> <li>• <b>Off:</b> Do not filter by event message.</li> <li>• <b>On:</b> Enable filtering by event message.</li> </ul>
Match String (Event Message)	This field is only visible if filtering is enabled above. Enter a message which the event must contain. Only events with a message matching this string will be regarded. Please enter a string.

**Note:** The **Event Log (Windows API) Sensor** always performs a substring match. Please do not use any placeholder character. For example, enter **RAS** for any event source containing this string in partial or whole form.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>941</sup>.

- <http://kb.paessler.com/en/topic/59803>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.16 Exchange Backup (Powershell) Sensor

The Exchange Backup (Powershell) sensor monitors backups of an Exchange server using Remote PowerShell. It shows several states of an Exchange database backup, for example, the last full backup, the last differential backup, and if currently a backup is running.

**Note:** The parent device for this sensor must be an Exchange server version 2010 or higher.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

#### Requirement: Remote PowerShell and Remote Exchange Management Shell

This sensor type uses PowerShell commands. In order to monitor devices with this sensor, **Remote PowerShell** and **Remote Exchange Management Shell** have to be enabled on the server. Ensure that you have installed **PowerShell 2.0** or later on your probe machine. For more information, please see section **More** below.

#### Requirement: Fully Qualified Domain Name (FQDN)

In order to connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address. For more information, please see section **More** below.

#### Requirement: Elevated Rights

The user of this sensor needs elevated rights on the Exchange system. It is not sufficient to have administrator rights. Please see section **More** below for detailed information on rights management.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor backups of Exchange server databases, PRTG will create one sensor for each database you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
Exchange Databases to be monitored on this server	Select the databases you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
Database	Shows the name of the monitored database. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what will be done with the results the sensor receives. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> </ul>

## Sensor Settings

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see [Data Storage](#)<sup>[2074]</sup> section.

## Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>[224]</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings  
16 Exchange Backup (Powershell) Sensor

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

## Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

### 6.8.17 Exchange Database (Powershell) Sensor

The Exchange Database (Powershell) sensor monitors database information of an Exchange server using Remote PowerShell. It shows several states of an Exchange database, for example, its size, if the database is mounted, and if the database is recognized as valid.

**Note:** The parent device for this sensor must be an Exchange server version 2010 or higher.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

#### Requirement: Remote PowerShell and Remote Exchange Management Shell

This sensor type uses PowerShell commands. In order to monitor devices with this sensor, **Remote PowerShell** and **Remote Exchange Management Shell** have to be enabled on the server. Ensure that you have installed **PowerShell 2.0** or later on your probe machine. For more information, please see section **More** below.

#### Requirement: Fully Qualified Domain Name (FQDN)

In order to connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address. For more information, please see section **More** below.

#### Requirement: Elevated Rights

The user of this sensor needs elevated rights on the Exchange system. It is not sufficient to have administrator rights. Please see section **More** below for detailed information on rights management.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor databases of an Exchange server, PRTG will create one sensor for each database you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

### Sensor Settings

Exchange Databases to be monitored on this server

Select the databases you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name

Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

Tags

Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically [inherited](#)<sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

Priority

Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### Sensor Settings

Database

Shows the name of the monitored database. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

AutoRemount Database

Define if you want the sensor to try to remount the database automatically if it is unmounted. Choose between:

- **Try to remount**
- **Just report the current reading, keep unmounted if so**

Sensor Settings	
Sensor Result	<p>Define what will be done with the results the sensor receives. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>[2074]</sup> section.</li> </ul>
Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>[224]</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

### Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.18 Exchange Mailbox (Powershell) Sensor

The Exchange Mailbox (Powershell) sensor monitors mailboxes of an Exchange server using Remote PowerShell. It shows several states of a mailbox, for example, total size of items, the number of items, and the time of the last login.

**Note:** The parent device for this sensor must be an Exchange server version 2010 or higher.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

#### Requirement: Remote PowerShell and Remote Exchange Management Shell

This sensor type uses PowerShell commands. In order to monitor devices with this sensor, **Remote PowerShell** and **Remote Exchange Management Shell** have to be enabled on the server. Ensure that you have installed **PowerShell 2.0** or later on your probe machine. For more information, please see section **More** below.

#### Requirement: Fully Qualified Domain Name (FQDN)

In order to connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address. For more information, please see section **More** below.

#### Requirement: Elevated Rights

The user of this sensor needs elevated rights on the Exchange system. It is not sufficient to have administrator rights. Please see section **More** below for detailed information on rights management.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor mailboxes of Exchange servers, PRTG will create one sensor for each mailbox you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
Mailboxes to be monitored	Select the mailboxes you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
Mailbox Name	Shows the name of the monitored mailbox. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what will be done with the results the sensor receives. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> </ul>

## Sensor Settings

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see [Data Storage](#)<sup>[2074]</sup> section.

## Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>[224]</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

## Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

### 6.8.19 Exchange Mail Queue (Powershell) Sensor

The Exchange Mail Queue (Powershell) sensor monitors the number of items in the outgoing mail queue of an Exchange server using Remote PowerShell. It shows, for example, queued mails, retrying mails, unreachable mails, and poisonous mails. See section [More](#)<sup>[423]</sup> below for an explanation of the transport queue types.

**Note:** The parent device for this sensor must be an Exchange server version 2010 or higher.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

#### Requirement: Remote PowerShell and Remote Exchange Management Shell

This sensor type uses PowerShell commands. In order to monitor devices with this sensor, **Remote PowerShell** and **Remote Exchange Management Shell** have to be enabled on the server. Ensure that you have installed **PowerShell 2.0** or later on your probe machine. For more information, please see section **More** below.

#### Requirement: Fully Qualified Domain Name (FQDN)

In order to connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address. For more information, please see section **More** below.

#### Requirement: Elevated Rights

The user of this sensor needs elevated rights on the Exchange system. It is not sufficient to have administrator rights. Please see section **More** below for detailed information on rights management.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor message queues of Exchange servers, PRTG will create one sensor for each role you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
Hub-Transport or Edge-Server	Select the roles you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
Sensor Result	<p>Define what will be done with the results the sensor receives. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>[2074]</sup> section.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## 6.8.20 Exchange Public Folder (Powershell) Sensor

The Exchange Public Folder (Powershell) sensor monitors public folders of an Exchange server using Remote PowerShell. It shows several states of a public folder, for example, its total size, the number of items, and the time of the last access.

**Note:** The parent device for this sensor must be an Exchange server version 2010 or higher.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

### Requirement: Remote PowerShell and Remote Exchange Management Shell

This sensor type uses PowerShell commands. In order to monitor devices with this sensor, **Remote PowerShell** and **Remote Exchange Management Shell** have to be enabled on the server. Ensure that you have installed **PowerShell 2.0** or later on your probe machine. For more information, please see section **More** below.

### Requirement: Fully Qualified Domain Name (FQDN)

In order to connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address. For more information, please see section **More** below.

### Requirement: Elevated Rights

The user of this sensor needs elevated rights on the Exchange system. It is not sufficient to have administrator rights. Please see section **More** below for detailed information on rights management.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor public folders of Exchange servers, PRTG will create one sensor for each folder you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
Public Folder	Select the folders you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
Public Folder	Shows the name of the monitored folder. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what will be done with the results the sensor receives. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> </ul>

Sensor Settings	
	<ul style="list-style-type: none"> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>[2074]</sup> section.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>[224]</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

### Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.21 EXE/Script Sensor

The EXE/Script sensor runs an executable file (EXE, DLL) or a script (batch file, VBScript, Powershell) on the computer running the local or remote probe. This option is provided as part of PRTG's Application Programming Interface (API). The sensor shows the execution time, and can show one value returned by the executable file or script (in one channel only). For details about the return value format please see the [Application Programming Interface \(API\) Definition](#)<sup>2031</sup>.

**Note:** The executable or script file must be stored on the system of the probe the sensor is created on: If used on a remote probe, the file must be stored on the system running the remote probe. In a cluster setup, please copy the file to every cluster node.

**Note:** If you want to execute a custom Windows Management Instrumentation Query Language (WQL) script, please use the [WMI Custom Sensor](#)<sup>1529</sup>.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
Script	<p>Select an executable file from the list. It will be executed with every scanning interval. In this list, files in the corresponding <b>/Custom Sensors/EXE</b> sub-directory of the probe system's PRTG program directory are shown (see <a href="#">Data Storage</a><sup>[2074]</sup>). In order for the files to appear in this list, please store them into this folder. Store files ending in BAT, CMD, DLL, EXE, PS1, and VBS. In order for the sensor to show the expected values and sensor status, your files must use the right format for the returned values (in this case, <b>value:message</b> to standard output). The file's exitcode will determine the sensor status. For detailed information on how to build custom sensors and for the expected return format, please see the API documentation (<a href="#">Application Programming Interface (API) Definition</a><sup>[2031]</sup>). There, find detailed information the the "Custom Sensors" tab.</p> <p><b>Note:</b> Please do not use the folder <b>\Custom Sensors\Powershell Scripts</b> to store your files. This remnant from previous software versions is not used any more and may usually be deleted.</p> <p><b>Note:</b> When using custom sensors on the <b>Cluster Probe</b>, please copy your files to every cluster node installation.</p>
Value Type	<p>Define what kind of values your executable or script file gives back. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Integer:</b> An integer is expected as return value. If the script gives back a float, PRTG will display the value <b>0</b>.</li> <li>▪ <b>Float:</b> A float is expected as return value, with a dot (.) between pre-decimal position and decimal places. In this setting, the sensor will also display integer values unless they don't produce a buffer overflow.</li> <li>▪ <b>Counter:</b> Your script returns an integer which increases. PRTG will show the difference between the values of two sensor scans. <b>Note:</b> A counter <b>must</b> return an integer; float is not supported here!</li> </ul>
Channel Name	Enter a name for the channel in which the returned values will be shown. This is for display purposes only. Please enter a string.
Unit String	Enter a string describing the unit of the returned values. This is for display purposes only. Please enter a string.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
EXE/Script	Shows the executable or script file that is executed with each sensor scan, as defined on sensor creation. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Parameters	If your executable or script file catches command line parameters, you can define them here. Placeholders can be used as well. For a full list of all placeholders please see the API documentation ( <a href="#">Application Programming Interface (API) Definition</a> <sup>[2031]</sup> ). Note: Please make sure you write the placeholders in quotes to ensure that they are working properly if their values contain blanks. Use single quotation marks ' ' with PowerShell scripts, and double quotes " " with all others. Please enter a string or leave the field empty.
Environment	Choose if PRTG's command line parameters will also be available as environment parameters. <ul style="list-style-type: none"> <li>▪ <b>Default Environment:</b> Do not provide PRTG placeholders' values in the environment. Choose this secure option if you're not sure.</li> </ul>

Sensor Settings	
	<ul style="list-style-type: none"> <li>▪ <b>Set placeholders as environment values:</b> From within your executable or script, the values of PRTG's command line parameters will be available via environment variables. For example, you can then read and use the current <b>host</b> value of the PRTG device this EXE/script sensor is created on from within your script. This option can mean a security risk, because also credentials are provided in several variables. For a full list of all available variables please see the API documentation (<a href="#">Application Programming Interface (API) Definition</a><sup>[2031]</sup>).</li> </ul>
Security Context	<p>Define the Windows user account that will be used to run the executable or script file. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use security context of probe service:</b> Run the selected file under the same Windows user account the probe is running on. By default, this is the Windows system user account (if not manually changed).</li> <li>▪ <b>Use Windows credentials of parent device:</b> Use the Windows user account defined in the settings of the parent device this sensor is created on. Please go to sensor's parent device's settings to change these Windows credentials.</li> </ul>
Mutex Name	<p>Define any desired mutex name for the process. All EXE/Script sensors having the same mutex name will be executed serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes running simultaneously. For links to more information, please see the <a href="#">More</a><sup>[438]</sup> section below. Please enter a string or leave the field empty.</p>
Timeout (sec.)	<p>Enter a timeout in seconds for the request. If the reply takes longer than this value the external process is killed and an error message is triggered.</p>
Value Type	<p>Shows the expected value type, chosen on sensor creation. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew. <b>Note:</b> The sensor cannot handle string values.</p>
If Value Changes	<p>Define what shall be done in case the value of this sensor changes. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore changes (default):</b> No action will be taken on change.</li> <li>▪ <b>Trigger 'On Change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a><sup>[1716]</sup> whenever the sensor value changes.</li> </ul>

Sensor Settings	
EXE Result	<p>Define what will be done with the result the executable file gives back. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard EXE result:</b> Do not store the requested web page.</li> <li>▪ <b>Write EXE result to disk:</b> Store the last result received from the script with the file name "Result of Sensor [ID].txt" to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> <li>▪ <b>Write EXE result to disk in case of error:</b> Store the last result received from the script only if the sensor is in a down status. The file name is "Result of Sensor [ID].txt" in the "Logs (Sensors)" directory. Enable this option if you do not want failures to be overwritten by a following success of the script.</li> </ul>
Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)  1709 section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)  1716 section.

## Others

For more general information about settings, please see [Object Settings](#)  142 section.

## 6.8.22 EXE/Script Advanced Sensor

The EXE/Script Advanced sensor runs an executable file (EXE, DLL) or a script (batch file, VBScript, Powershell) on the computer running the local or remote probe. This option is provided as part of PRTG's Application Programming Interface (API). The sensor can show values returned by the executable file or script in multiple channels. The return value of this sensor must be valid XML. For details about the return value format please see the [Application Programming Interface \(API\) Definition](#) <sup>2031</sup>.

**Note:** The executable or script file must be stored on the system of the probe the sensor is created on: If used on a remote probe, the file must be stored on the system running the remote probe. In a cluster setup, please copy the file to every cluster node.

**Note:** If you want to execute a custom Windows Management Instrumentation Query Language (WQL) script, please use the [WMI Custom Sensor](#) <sup>1529</sup>.

### Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
EXE/Script	Select an executable file from the list. It will be executed with every scanning interval. In this list, files in the corresponding <b>/Custom Sensors/EXEXML</b> sub-directory of the probe system's PRTG program directory are shown (see <a href="#">Data Storage</a> <sup>2074</sup> ). In order for the files to appear in this list, please store them into this folder. Store files ending in BAT, CMD, DLL, EXE, PS1, and VBS. In order for the sensor to show the expected values and sensor status, your files must return the expected XML format to standard output. Values and message must be embedded in the XML. For detailed information on how to build custom sensors and for the expected return format, please see the API documentation ( <a href="#">Application Programming Interface (API) Definition</a> <sup>2031</sup> ). There, find detailed information the the "Custom Sensors" tab.

### Sensor Settings

**Note:** Please do not use the folder `\Custom Sensors\Powershell Scripts` to store your files. This remnant from previous software versions is not used any more and may usually be deleted.

**Note:** When using custom sensors on the **Cluster Probe**, please copy your files to every cluster node installation.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### Sensor Settings

EXE/Script	Shows the executable or script file that is executed with each sensor scan, as defined on sensor creation. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Parameters	<p>If your executable or script file catches command line parameters, you can define them here. Placeholders can be used as well. For a full list of all placeholders please see the API documentation (<a href="#">Application Programming Interface (API) Definition</a>). Note: Please make sure you write the placeholders in quotes to ensure that they are working properly if their values contain blanks. Use single quotation marks ' ' with PowerShell scripts, and double quotes " " with all others. Please enter a string or leave the field empty.</p>
Environment	<p>Choose if PRTG's command line parameters will also be available as environment parameters.</p> <ul style="list-style-type: none"><li>▪ <b>Default Environment:</b> Do not provide PRTG placeholders' values in the environment. Choose this secure option if you're not sure.</li><li>▪ <b>Set placeholders as environment values:</b> From within your executable or script, the values of PRTG's command line parameters will be available via environment variables. For example, you can then read and use the current <b>host</b> value of the PRTG device this EXE/script sensor is created on from within your script. This option can mean a security risk, because also credentials are provided in several variables. For a full list of all available variables please see the API documentation (<a href="#">Application Programming Interface (API) Definition</a>).</li></ul>
Security Context	<p>Define the Windows user account that will be used to run the executable or script file. Choose between:</p> <ul style="list-style-type: none"><li>▪ <b>Use security context of probe service:</b> Run the selected file under the same Windows user account the probe is running on. By default, this is the Windows system user account (if not manually changed).</li></ul>

	<ul style="list-style-type: none"> <li>▪ <b>Use Windows credentials of parent device:</b> Use the Windows user account defined in the settings of the parent device this sensor is created on. Please go to sensor's parent device's settings to change these Windows credentials.</li> </ul>
Mutex Name	<p>Define any desired mutex name for the process. All EXE/Script sensors having the same mutex name will be executed serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes running simultaneously. For links to more information, please see the <a href="#">More</a><sup>447</sup> section below. Please enter a string or leave the field empty.</p>
Timeout (sec.)	<p>Enter a timeout in seconds for the request. If the reply takes longer than this value the external process is killed and an error message is triggered.</p>
EXE Result	<p>Define what will be done with the results the executable file gives back. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard EXE result:</b> Do not store the requested web page.</li> <li>▪ <b>Write EXE result to disk:</b> Store the last result received from the script with the file name "Result of Sensor [ID].txt" to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>2074</sup> section.</li> </ul>

- **Write EXE result to disk in case of error:** Store the last result received from the script only if the sensor is in a down status. The file name is "Result of Sensor [ID].txt" in the "Logs (Sensors)" directory. Enable this option if you do not want failures to be overwritten by a following success of the script.

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Note:** The **Stack Unit** option for stacking graphs will only work if you explicitly define the same **<unit>** for at least two channels. For detailed information about sensor settings please see the API documentation ([Application Programming Interface \(API\) Definition](#)<sup>2031</sup>).

### Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root**<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)  1709 section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)  1716 section.

## Others

For more general information about settings, please see [Object Settings](#)  142 section.

### 6.8.23 File Sensor

The File sensor monitors a file located on the probe's local disk, or a file accessible via Server Message Block (SMB). You can monitor file content and file time stamp changes. The sensor shows the file size, and a last modified value in days and hours.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Specific	
File Name	Enter the full path to the file this sensor will monitor. For example, enter <b>C:\Windows\file.txt</b> . If the file is located on a network device use the Uniform Naming Convention (UNC) path <b>without</b> the server part (you would only enter <b>share\folder\file.txt</b> ). The server part ( <b>\server\</b> ) is taken from this sensor's parent device's settings. Please enter a valid path and file name. <b>Note:</b> In order to provide any shares, the <b>LanmanServer</b> "Server" Windows service must be running on the target computer.
Check If	Specify when the sensor will send an alert. Choose between: <ul style="list-style-type: none"> <li>▪ <b>File exists:</b> The sensor will send an alert if the file does not exist.</li> <li>▪ <b>File does not exist:</b> The sensor will send an alert if the file exists.</li> </ul>
Monitor File Content	Specify if the sensor will send a change notification when the content of the file changes (based on a checksum). Choose between: <ul style="list-style-type: none"> <li>▪ <b>Ignore changes:</b> No action will be taken on change.</li> <li>▪ <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <small>1716</small> whenever the sensor value changes.</li> </ul>
Monitor File Time Stamp	Specify if the sensor will send a change notification when the content of the file's time stamp changes. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Ignore changes:</b> No action will be taken on change.</li> <li>▪ <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <small>1716</small> whenever the sensor value changes.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## More

Knowledge Base: What can I do if PRTG doesn't succeed with monitoring a share? PE029 PE032

- <http://kb.paessler.com/en/topic/513>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.24 File Content Sensor

The File Content sensor checks a text file for certain strings and returns the line number of the last match and the number of total matches. Additionally, matching lines are quoted in the sensor message field.

**Note:** This sensor does **not** support UTF-16 encoded files! In this case, please try use a custom sensor like the [EXE/Script Sensor](#)<sup>[431]</sup> or the [EXE/Script Advanced Sensor](#)<sup>[440]</sup>.

**Note:** This sensor supports Unix line feeds.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
File Name	<p>Enter the full path to the file this sensor will monitor. For example, enter <b>C:\Windows\file.txt</b>. If the file is located on a network device use the Uniform Naming Convention (UNC) path <b>without</b> the server part (you would only enter <b>share\folder\file.txt</b>). The server part (<b>\server\</b>) is taken from this sensor's parent device's settings. Please enter a valid path and file name. <b>Note:</b> In order to provide any shares, the <b>LanmanServer</b> "Server" Windows service must be running on the target computer. <b>Note:</b> If you define a file on your network here, please be aware that this might produce high network traffic, because PRTG will query the entire file with every scanning interval.</p>
Search String	<p>Define the string inside the log file you would like to check for. The input is <b>not</b> case-sensitive. Please enter a string.</p>
Search Method	<p>Define the method you want to provide the search string with. The pattern must be contained in <b>one</b> line and only the <b>last</b> matching line will be given back. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Simple string search:</b> Search for a simple string.</li> <li>▪ <b>Regular Expression:</b> Search using a regular expression. For more details, see <a href="#">Regular Expressions</a> <sup>2048</sup> section.</li> </ul>
Warning Behaviour	<p>Define under which condition the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Go into warning status when string is not found:</b> The sensor will show a Warning status if there is <b>no</b> match. Otherwise it will remain in <b>Up</b> status.</li> <li>▪ <b>Go into warning status when string is found:</b> The sensor will show a Warning status if there <b>is</b> a match. Otherwise it will remain in <b>Up</b> status.</li> </ul>
If Value Changes	<p>Define what shall be done in case the value of this sensor changes. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore changes:</b> No action will be taken on change.</li> <li>▪ <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <sup>1716</sup> whenever the sensor value changes.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <small>1817</small> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

### Channel Unit Configuration

#### Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

**Note:** Custom channel types can be set on sensor level only.

### Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

### Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

### Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.25 Folder Sensor

The Folder sensor monitors a folder using Server Message Block (SMB). You can monitor file changes and file ages. It shows the folder size and file count, as well as the oldest and newest file value in days and hours.

**Note:** The Folder sensor counts all files in a folder, including **hidden files**.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Folder Monitor	
Folder Name	Enter the full path to the folder this sensor will monitor. For example, enter <b>C:\Windows</b> . If the file is located on a network device, use the Uniform Naming Convention (UNC) path <b>without</b> the server part (you would only enter <b>share\folder</b> ). The server part ( <b>\server\</b> ) is taken from this sensor's parent device's settings. Please enter a valid path name. <b>Note:</b> In order to provide any shares, the <b>LanmanServer</b> "Server" Windows service must be running on the target computer.
Sub-Folder Recursion	Specify if subfolders will be included in the monitoring. Choose between: <ul style="list-style-type: none"> <li>• <b>Do not recurse sub-folders:</b> Only monitor the folder specified above; do not monitor its subfolders.</li> <li>• <b>Monitor the folder and its sub-folders (use with caution!):</b> Monitor the folder specified above and all of its subfolders. <b>Note:</b> Recursing sub-folders in large directories with a high number of branches may evoke timeout errors or performance issues.</li> </ul>
Monitor Folder Changes	Specify if the sensor will send a change notification when the content of the folder changes. Choose between: <ul style="list-style-type: none"> <li>• <b>Ignore changes:</b> Changes to the folder will not trigger a change notification.</li> <li>• <b>Trigger 'On Change' notification:</b> The sensor will trigger a change notification if a file changes its timestamp or filename, or if there are new or deleted files.</li> </ul>
Check of File Ages	Specify if the sensor will monitor the folder for certain file ages. Choose between: <ul style="list-style-type: none"> <li>• <b>Don't check:</b> Do not check for the age of the files in the specified folder(s).</li> <li>• <b>Show Warning if older:</b> Set the sensor to warning status if one of the files in the specified folder is older than a specific time unit.</li> <li>• <b>Show Error if older:</b> Set the sensor to error status if one of the files in the specified folder is older than a specific time unit.</li> <li>• <b>Show Warning if younger:</b> Set the sensor to warning status if one of the files in the specified folder is younger than a specific time unit.</li> <li>• <b>Show Error if younger:</b> Set the sensor to error status if one of the files in the specified folder is younger than a specific time unit.</li> </ul>
File Age Limit	This field is only visible if a file age check is enabled above. Enter the age of a file in the folder that will trigger the sensor's status change if undershot respectively overrun. Please enter an integer value. The value will be interpreted as days, hours, or minutes; according to your setting below.
File Age Limit Unit	This field is only visible if a file age check is enabled above. Specify the unit for the file age value you entered above. Choose between:

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>  . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

- <http://kb.paessler.com/en/topic/513>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.26 FTP Sensor

The FTP sensor monitors file servers using File Transfer Protocol (FTP) and FTP over SSL (FTPS). It shows the response time.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Sensor Specific	
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered. The highest timeout supported is <b>900</b> seconds (15 minutes). Please enter an integer value.

Sensor Specific	
Port	Enter the number of the port the sensor will try to connect to. For non-secure connections usually port <b>21</b> is used, for implicit secure connections usually port <b>990</b> . Please enter an integer value. We recommend using the default value. If you do not get a connection, please try another port number.
FTP Mode	<p>Specify which FTP mode will be used for the connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use active mode</b></li> <li>▪ <b>Use passive mode</b></li> </ul> <p>We recommend using the default value. If you do not get a connection, please try the passive mode.</p>

Authentication	
Username	Enter a username for the FTP login. Please enter a string or leave the field empty.
Password	Enter a password for the FTP login. Please enter a string or leave the field empty.
TLS (Transport-Level-Security)	<p>Specify if an encryption will be used for the connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Don't use SSL (Basic FTP, recommended):</b> In most cases, you will use basic FTP without encryption.</li> <li>▪ <b>Use Explicit SSL/TLS if available:</b> The sensor will try to connect via <b>Explicit SSL</b>. If SSL/TLS is not supported by the server, the sensor will try to connect without SSL/TLS and is set to <b>Up</b> if this works. If the server supports SSL/TLS but the connection fails (for example, due to a <b>TLS handshake failure</b>), the sensor will turn into <b>Down</b> status.</li> <li>▪ <b>Enforce Explicit SSL/TLS:</b> The connection <b>must</b> be established using <b>Explicit SSL/TLS</b>. Otherwise, the sensor will go into <b>Down</b> status.</li> <li>▪ <b>Use Implicit SSL/TLS:</b> The sensor will try to connect using <b>Implicit SSL/TLS</b>. Negotiating authentication and security is not allowed in implicit mode. The client is expected to challenge the FTP server with a TLS/SSL <b>ClientHello</b> message. If the server does not receive such a message, it will drop the connection. The sensor will go into <b>Down</b> status.</li> </ul>

Authentication	
	<p><b>Note:</b> Ensure that you choose the method your FTP server uses! If your server uses <b>Implicit SSL/TLS</b>, the <b>Explicit SSL/TLS</b> connection will not work.</p>
Sensor Result	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <b>Result of Sensor [ID].txt</b>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>
Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

## Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

**Notifications**

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

**Others**

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.27 FTP Server File Count Sensor

The FTP Server File Count sensor logs in to an FTP server and returns the number of files available in the directory listing.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 2.0.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
Channel Name	Enter a name for the channel in which the returned values will be shown. This is for display purposes only. Please enter a string.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
FTP URL	Enter the URL to check (this sensor does <b>not</b> use the <b>IP Address/DNS value</b> of the parent device).
Username	Define the username for the login. Please enter a string.
Password	Define the password for the login. Please enter a string.
Count Only New Files	Define if only new files will be counted. Choose between: <ul style="list-style-type: none"> <li>▪ <b>No</b>: Always show the total number of files.</li> <li>▪ <b>Yes</b>: Show the number of new files since the last scanning interval. <b>Note</b>: With the next sensor scan, any new files from the previous scan will be regarded as old.</li> </ul>
If Value Changes	Define what shall be done in case the value of this sensor changes. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Ignore changes</b>: No action will be taken on change.</li> <li>▪ <b>Trigger 'change' notification</b>: The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a><sup>[1716]</sup> whenever the sensor value changes.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <small>1817</small> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.28 Google Analytics Sensor

The Google Analytics sensor queries data from a Google Analytics account via Hypertext Transfer Protocol (HTTP). It shows the values for different metrics in different sensor channels.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 2.0.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings  
28 Google Analytics Sensor

### Basic Sensor Settings

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Google Analytics Settings

Period (Interval)	Enter how often the sensor will query data. Choose between: <ul style="list-style-type: none"> <li>▪ 1 Day</li> <li>▪ 2 Days</li> <li>▪ 3 Days</li> <li>▪ 1 Week</li> </ul>
Username	Please enter the username of the Google Analytics account you want to query. Please enter a string.
Password	Please enter the password of the Google Analytics account you want to query. Please enter a string.
Profile ID	Enter the 8-digits profile ID of the Google Analytics account. For help, please see <a href="#">More</a> <sup>484</sup> section below.
Metrics	Enter a comma separated list with all metrics you want to query. A default set of metrics is already predefined. For help, please see <a href="#">More</a> <sup>484</sup> section below.
Days	Define for how many days the sensor will query data. Enter <b>1</b> to query yesterday's data only, or define any number of days. Please enter an integer value.
Average	Define if the sensor will query averaged data. Select between: <ul style="list-style-type: none"> <li>▪ <b>Use:</b> Query averaged data. This setting only takes effect if your entered more than "1" in the <b>Days</b> setting above. Data will be averaged over the number of days.</li> <li>▪ <b>Don't use:</b> Do not query averaged data, but receive raw data.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Note:** For Google Analytics sensors, the scanning interval cannot be inherited. Please use the individual settings of the sensor to define the interval in which data is received.

## Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

### Channel Unit Configuration

Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>
--------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Proxy Settings for HTTP Sensors

HTTP Proxy Settings	<p>The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. <b>Note:</b> This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see <a href="#">System Administration—Core &amp; Probes</a> <sup>1849</sup>.</p>
Name	<p>Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.</p>
Port	<p>Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.</p>
User	<p>If the proxy requires authentication, enter the username for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.</p>
Password	<p>If the proxy requires authentication, enter the password for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.29 HTTP Sensor

The HTTP sensor monitors a web server using Hypertext Transfer Protocol (HTTP). It shows the loading time. This is the easiest way to monitor if a website (or a specific website element) is reachable.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
HTTP Specific	
Timeout (Sec.)	Enter a timeout in seconds for the HTTP request. If the reply takes longer than this value the request is aborted and an error message is triggered. The maximum value is <b>900</b> seconds (15 minutes).

HTTP Specific	
URL	Please enter the URL the sensor will connect to. It has to be <b>URL encoded</b> ! If you enter an absolute URL, this address will be independent from the <b>IP address/DNS name</b> setting of the device this sensor is created on. You can enter an URL leading to a webpage (to measure the page source code's loading time), or enter the URL of an image or of another page asset to measure this element's availability and loading time. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section <b>Smart URL Replacement</b> below.
Request Method	<p>The request method determines how the given URL is requested.</p> <ul style="list-style-type: none"> <li>▪ <b>GET</b>: Request the website directly, like browsing the web. We recommend using this setting for a simple check of a web page.</li> <li>▪ <b>POST</b>: Send post form data to the URL. If this setting is chosen, you must enter the data that will be sent in the <b>Postdata</b> field below.</li> <li>▪ <b>HEAD</b>: Only request the HTTP header from the server; without the actual web page. Although this saves bandwidth since less data is transferred, it is not recommended because the measured request time is not the one experienced by your users and you might not be notified for slow results or timeouts.</li> </ul>
Postdata	This field is only visible when POST is selected in the <b>Request Method</b> setting above. Please enter the data part for the POST request here. <b>Note</b> : No XML is allowed here!
Content Type	<p>This setting is only visible when POST is selected in the <b>Request Method</b> setting above. Define the content type of a POST request. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Default (application/x-www-form-urlencoded)</b>: This is the default content type used to encode the form data set for submission to the server.</li> <li>▪ <b>Custom</b>: If you need another content type than default, enter this content type below.</li> </ul>
Custom Content Type	This field is only visible when <b>Custom</b> is selected above. Define the content type which is needed, e.g., XML, JSON, HTTP.
SSL Specific	
SSL Method	This setting is relevant only when using https in the <b>URL</b> field. We recommend using the default value. If you experience connection problems, please select another SSL method from the list. Choose between:

SSL Specific	
	<ul style="list-style-type: none"> <li>▪ <b>SSL V2</b></li> <li>▪ <b>SSL V2 or V3:</b> This is the default setting.</li> <li>▪ <b>SSL V3</b></li> <li>▪ <b>TLS V1</b></li> </ul> <p><b>Note:</b> Other TLS versions are not supported.</p>

**Note:** This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Proxy Settings for HTTP Sensors**

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. <b>Note:</b> This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see <a href="#">System Administration—Core &amp; Probes</a> <sup>1849</sup> .
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.

**Scanning Interval**

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

## Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either [http:///](#) or [https:///](#) or even a simple slash [/](#) as equivalent for [http:///](#)). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** [www.example.com](#) and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value [https:///](#) in the URL field, PRTG will automatically create the URL [https://www.example.com/](#) from that.
- Using the value [/help](#) in the URL field, PRTG will automatically create and monitor the URL [http://www.example.com/help](#)
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, [http://:8080/](#)

**Note:** Smart URL replacement does not work for sensors running on the "Probe Device".

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.30 HTTP Advanced Sensor

The HTTP Advanced sensor monitors the source code of a web page using Hypertext Transfer Protocol (HTTP). It supports authentication, content checks, and other advanced parameters. It shows the loading time, bytes received, download bandwidth (speed), and time to first byte.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
HTTP Specific	
Timeout (Sec.)	Enter a timeout in seconds for the HTTP request. If the reply takes longer than this value the request is aborted and an error message is triggered. The maximum value is <b>900</b> seconds (15 minutes).

HTTP Specific	
URL	Please enter the URL the sensor will connect to. It has to be <b>URL encoded</b> ! If you enter an absolute URL, this address will be independent from the <b>IP address/DNS name</b> setting of the device this sensor is created on. You can enter an URL leading to a webpage (to measure the page source code's loading time), or enter the URL of an image or of another page asset to measure this element's availability and loading time. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section <b>Smart URL Replacement</b> below.
Request Method	<p>The request method determines how the given URL is requested.</p> <ul style="list-style-type: none"> <li>▪ <b>GET</b>: Request the website directly, like browsing the web. We recommend using this setting for a simple check of a web page.</li> <li>▪ <b>POST</b>: Send post form data to the URL. If this setting is chosen, you must enter the data that will be sent in the <b>Postdata</b> field below.</li> <li>▪ <b>HEAD</b>: Only request the HTTP header from the server; without the actual web page. Although this saves bandwidth since less data is transferred, it is not recommended because the measured request time is not the one experienced by your users and you might not be notified for slow results or timeouts.</li> </ul>
Postdata	This field is only visible when POST is selected in the <b>Request Method</b> setting above. Please enter the data part for the POST request here. <b>Note</b> : No XML is allowed here!
Content Type	<p>This setting is only visible when POST is selected in the <b>Request Method</b> setting above. Define the content type of a POST request. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Default (application/x-www-form-urlencoded)</b>: This is the default content type used to encode the form data set for submission to the server.</li> <li>▪ <b>Custom</b>: If you need another content type than default, enter this content type below.</li> </ul>
Custom Content Type	This field is only visible when <b>Custom</b> is selected above. Define the content type which is needed, e.g., XML, JSON, HTTP.

HTTP Engine	
Monitoring Engine	If you encounter unexpected errors with the standard method that is used to monitor an URL, try to use the compatibility mode which is based on <b>.Net</b> (introduced in PRTG v13.x.7). Choose between:

**HTTP Engine**

- **Default/High Performance (recommended):** This is the default monitoring method for this sensor type.
- **Alternate/Compatibility Mode:** Try this method as an alternative for websites that do not work with the default approach. Using the compatibility mode, this sensor will execute an external **exe**. Thus, this method will need more resources, but it can be helpful in particular cases. **Note:** If you select the compatibility mode, the options for the SSL method will be slightly different. You can also check for trusted certificates. Please see below.  
**Note:** When using the Compatibility Mode, **Smart URL Replacement** will not work, i.e., this sensor does **not** use the **IP Address/DNS value** of the parent device automatically then.

**SSL Specific**

## SSL Method

This setting is relevant only when using https in the **URL** field. We recommend using the default value. If you experience connection problems, please select another SSL method from the list. Choose between:

- **SSL V2**
- **SSL V2 or V3:** This is the default setting.
- **SSL V3**
- **TLS V1**

**Note:** Other TLS versions are not supported.

**SSL Specific (when using Compatibility Mode)**

## SSL Method

When using the compatibility mode, the SSL specific settings are a bit different to the default SSL settings. SSL V2 is not available. You can choose between:

- **SSL V3**
- **TLS V1**
- **SSL V3 or TLS V1:** This is the default setting.

## Check SSL Certificates

Specify if the certificate of the monitored URL will be checked. Choose between:

- **Do not check used certificates:** This the default setting.

**SSL Specific (when using Compatibility Mode)**

- **Check if the used certificates are trusted:** If the certificate of the server is not trusted, the sensor will go into a **Down** status and display a corresponding message.

**Note:** This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

**Advanced Sensor Data**

Protocol Version	<p>Define the HTTP protocol version that will be used when connecting to the URL. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>HTTP 1.0</b></li> <li>▪ <b>HTTP 1.1:</b> This is the default setting.</li> </ul>
User Agent	<p>Choose which user agent string will be sent by this sensor when connecting to the URL defined above. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use PRTG's Default String:</b> Do not enter a specific user agent, use default setting. Usually, this is: <b>Mozilla/5.0 (compatible; PRTG Network Monitor (www.paessler.com); Windows)</b></li> <li>▪ <b>Use a Custom String:</b> Use a custom user agent. Define below.</li> </ul>
Custom User Agent	<p>This field is only visible if custom user agent is enabled above. Enter a string which will be used as user agent when connecting to the URL specified above.</p>
Content Changes	<p>Define what will be done in case the content of the monitored web page (element) changes. You can choose between:</p> <ul style="list-style-type: none"> <li>• <b>Ignore changes:</b> No action will be taken on change.</li> <li>• <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that the web page content has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <sup>1716</sup> whenever the web page content changes.</li> </ul>
Check For Existing Key Words (Positive)	<p>Define whether the the result at the configured URL will be checked for keywords. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Disable:</b> Do not search for keywords.</li> <li>▪ <b>Enable key word check (positive):</b> In the result returned at the URL, check if a key word exists.</li> </ul> <p><b>Note:</b> The content check is only intended for html websites and might not work with other target URLs.</p>

Advanced Sensor Data	
Response Must Include	This field is only visible if keyword checking is enabled above. Define which string must be part of the source code at the given URL. You can either enter plain text or a <a href="#">Regular Expression</a> . If the data does not include the search pattern, the sensor will be set to an error state. Please enter a string.
For Key Word Search Use	<p>Define in which format you have entered the search expression in the field above.</p> <ul style="list-style-type: none"> <li>▪ <b>Plain Text:</b> Search for the string as plain text. The characters <b>*</b> and <b>?</b> work here as placeholder, whereas <b>*</b> stands for no or any number of characters and <b>?</b> stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search.</li> <li>▪ <b>Regular Expression:</b> Treat the search pattern as a <a href="#">Regular Expression</a>.</li> </ul>
Check For Existing Key Words (Negative)	<p>Define whether the the result at the configured URL will be checked for keywords. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Disable:</b> Do not search for keywords.</li> <li>▪ <b>Enable key word check (negative):</b> In the result returned at the URL, check if a key word does not exist.</li> </ul> <p><b>Note:</b> The content check is only intended for html websites and might not work with other target URLs.</p>
Response must not include	This field is only visible if keyword checking is enabled above. Define which string must <b>not</b> be part of the source code at the given URL. You can either enter plain text or a <a href="#">Regular Expression</a> . If the data <b>does</b> include this string, the sensor will be set to an error state. Please enter a string.
For Key Word Search Use	<p>Define in which format you have entered the search expression in the field above.</p> <ul style="list-style-type: none"> <li>▪ <b>Plain Text:</b> Search for the string as plain text. The characters <b>*</b> and <b>?</b> work here as placeholder, whereas <b>*</b> stands for no or any number of characters and <b>?</b> stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search.</li> <li>▪ <b>Regular Expression:</b> Treat the search pattern as a <a href="#">Regular Expression</a>.</li> </ul>

Advanced Sensor Data	
Limit Download (kb)	Enter a maximum amount of data that will be transferred per every single request. If you set content checks, please be aware that only the content downloaded up to this limit can be checked for search expressions.
Result Handling	<p>Define what will be done with the web page loaded at the given URL. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Discard HTML result:</b> Do not store the requested web page.</li> <li>• <b>Store latest HTML result:</b> Store the last result of the requested web page to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes, especially in combination with content checks. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <small>2074</small> section.</li> </ul>

**Note:** This sensor loads the source code at the given URL. If you set up a content check, only this source code is checked for the keywords. The code is not necessarily identical to the one used to display the page when opening the same URL in a web browser, as there may be a reload configured or certain information may be inserted after loading, e.g. via Javascript. PRTG does not follow links to embedded objects nor does it execute scripts. Only the first page at the given URL is loaded and checked against the expressions configured. For debugging, please use the **Result** option to write the source code file to disk and look up what exactly PRTG gets when calling the URL. If the URL configured does not point to a web page, but to a binary file, for example, to an image, you usually won't check for content.

Authentication	
Authentication	<p>Define if the web page at the configured URL need authentication. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No authentication needed</b></li> <li>▪ <b>Web page needs authentication</b></li> </ul>
User	This field is only visible if authentication is enabled above. Enter a username. Please enter a string.
Password	This field is only visible if authentication is enabled above. Enter a password. Please enter a string.
Authentication Method	This field is only visible if authentication is enabled above. Please select the authentication method the given URL is protected with. Choose between:

Authentication	
	<ul style="list-style-type: none"> <li>• <b>Basic access authentication (HTTP):</b> Use simple HTTP authentication. This is the default setting and suitable for most cases. <b>Note:</b> This authentication method will transmit credentials as plain text!</li> <li>• <b>Windows NT LAN Manager (NTLM):</b> Use the Microsoft NTLM protocol for authentication. This is sometimes used in Intranets for single sign-on.</li> </ul> <p>We recommend using the default value.</p>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Proxy Settings for HTTP Sensors	
HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. <b>Note:</b> This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see <a href="#">System Administration—Core &amp; Probes</a> <sup>1849</sup> .
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.
Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

### Channel Unit Configuration

#### Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

**Note:** Custom channel types can be set on sensor level only.

### Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either **http:///** or **https:///** or even a simple slash **/** as equivalent for **http:///**). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** **www.example.com** and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value **https:///** in the URL field, PRTG will automatically create the URL **https://www.example.com/** from that.
- Using the value **/help** in the URL field, PRTG will automatically create and monitor the URL **http://www.example.com/help**
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, **http://:8080/**

**Note:** Smart URL replacement does not work for sensors running on the "Probe Device".

### More

Knowledge Base: Which user agent should I use in the HTTP Advanced sensor's settings?

- <http://kb.paessler.com/en/topic/30593>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.31 HTTP Apache ModStatus PerfStats Sensor

The HTTP Apache ModStatus PerfStats sensor monitors performance statistics of an Apache web server using mod\_status over HTTP. It can show the CPU load, the uptime (in seconds), the requests per second, the bytes per request, and the number of current busy and idle worker threads of the Apache at scan time.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
HTTP Specific	
Timeout (Sec.)	Enter a timeout in seconds for the HTTP request. If the reply takes longer than this value the request is aborted and an error message is triggered. The maximum value is <b>900</b> seconds (15 minutes).

HTTP Specific	
URL	<p>Please enter the URL to the <b>mod_status</b> module on your Apache server; PRTG will append a <code>/server_status?auto</code> part automatically. If you enter an absolute URL, this address will be independent from the <b>IP address/DNS name</b> setting of the device this sensor is created on. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section <b>Smart URL Replacement</b> below.</p>

SSL Specific	
SSL Method	<p>This setting is relevant only when using https in the <b>URL</b> field. We recommend using the default value. If you experience connection problems, please select another SSL method from the list. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>SSL V2</b></li> <li>▪ <b>SSL V2 or V3</b>: This is the default setting.</li> <li>▪ <b>SSL V3</b></li> <li>▪ <b>TLS V1</b></li> </ul> <p><b>Note:</b> Other TLS versions are not supported.</p>

**Note:** This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

Authentication	
Authentication	<p>Define if the web page at the configured URL need authentication. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No authentication needed</b></li> <li>▪ <b>Web page needs authentication</b></li> </ul>
User	<p>This field is only visible if authentication is enabled above. Enter a username. Please enter a string.</p>
Password	<p>This field is only visible if authentication is enabled above. Enter a password. Please enter a string.</p>
Authentication Method	<p>This field is only visible if authentication is enabled above. Please select the authentication method the given URL is protected with. Choose between:</p>

Authentication	
	<ul style="list-style-type: none"> <li>• <b>Basic access authentication (HTTP):</b> Use simple HTTP authentication. This is the default setting and suitable for most cases. <b>Note:</b> This authentication method will transmit credentials as plain text!</li> <li>• <b>Windows NT LAN Manager (NTLM):</b> Use the Microsoft NTLM protocol for authentication. This is sometimes used in Intranets for single sign-on.</li> </ul> <p>We recommend using the default value.</p>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Proxy Settings for HTTP Sensors

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. <b>Note:</b> This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see <a href="#">System Administration—Core &amp; Probes</a> <sup>1849</sup> .
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

## Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either [http:///](#) or [https:///](#) or even a simple slash [/](#) as equivalent for [http:///](#)). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** [www.example.com](#) and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value [https:///](#) in the URL field, PRTG will automatically create the URL [https://www.example.com/](#) from that.
- Using the value [/help](#) in the URL field, PRTG will automatically create and monitor the URL [http://www.example.com/help](#)
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, [http://:8080/](#)

**Note:** Smart URL replacement does not work for sensors running on the "Probe Device".

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.32 HTTP Apache ModStatus Totals Sensor

The HTTP Apache ModStatus Totals sensor monitors accesses and transferred data (in kBytes) of an Apache web server using mod\_status over HTTP.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
HTTP Specific	
Timeout (Sec.)	Enter a timeout in seconds for the HTTP request. If the reply takes longer than this value the request is aborted and an error message is triggered. The maximum value is <b>900</b> seconds (15 minutes).

HTTP Specific	
URL	Please enter the URL to the <b>mod_status</b> module on your Apache server; PRTG will append a "/server_status?auto" part automatically. If you enter an absolute URL, this address will be independent from the <b>IP address/DNS name</b> setting of the device this sensor is created on. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section <b>Smart URL Replacement</b> below.

SSL Specific	
SSL Method	<p>This setting is relevant only when using https in the <b>URL</b> field. We recommend using the default value. If you experience connection problems, please select another SSL method from the list. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>SSL V2</b></li> <li>▪ <b>SSL V2 or V3</b>: This is the default setting.</li> <li>▪ <b>SSL V3</b></li> <li>▪ <b>TLS V1</b></li> </ul> <p><b>Note:</b> Other TLS versions are not supported.</p>

**Note:** This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

Authentication	
Authentication	<p>Define if the web page at the configured URL need authentication. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No authentication needed</b></li> <li>▪ <b>Web page needs authentication</b></li> </ul>
User	This field is only visible if authentication is enabled above. Enter a username. Please enter a string.
Password	This field is only visible if authentication is enabled above. Enter a password. Please enter a string.
Authentication Method	This field is only visible if authentication is enabled above. Please select the authentication method the given URL is protected with. Choose between:

Authentication	
	<ul style="list-style-type: none"> <li>• <b>Basic access authentication (HTTP):</b> Use simple HTTP authentication. This is the default setting and suitable for most cases. <b>Note:</b> This authentication method will transmit credentials as plain text!</li> <li>• <b>Windows NT LAN Manager (NTLM):</b> Use the Microsoft NTLM protocol for authentication. This is sometimes used in Intranets for single sign-on.</li> </ul> <p>We recommend using the default value.</p>
Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Proxy Settings for HTTP Sensors	
HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. <b>Note:</b> This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see <a href="#">System Administration—Core &amp; Probes</a> <sup>1849</sup> .
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.
Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

## Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either [http:///](#) or [https:///](#) or even a simple slash [/](#) as equivalent for [http:///](#)). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** [www.example.com](#) and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value [https:///](#) in the URL field, PRTG will automatically create the URL [https://www.example.com/](#) from that.
- Using the value [/help](#) in the URL field, PRTG will automatically create and monitor the URL [http://www.example.com/help](#)
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, [http://:8080/](#)

**Note:** Smart URL replacement does not work for sensors running on the "Probe Device".

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.33 HTTP Content Sensor

The HTTP Content sensor monitors a numerical value returned by a Hypertext Transfer Protocol (HTTP) request. In the returned HTML page, each value must be placed between square brackets `[ ]`.

#### Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[226]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

HTTP Specific	
Value Type	<p>Define what kind of values your HTML file gives back. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Integer:</b> An integer is expected as return value.</li> <li>▪ <b>Float:</b> A float is expected as return value, with a dot (.) between pre-decimal position and decimal places. In this setting, the sensor will also display integer values unless they don't produce a buffer overflow.</li> </ul> <p><b>Note:</b> The sensor cannot handle string values.</p>
Number of Channels	<p>Define how many values your HTML file gives back. Each value will be handled in its own sensor channel. Each value must be placed between square brackets <code>[ ]</code>. Enter the number of bracket-value pairs that will be returned at the defined URL. <b>Note:</b> Do not enter a number less than the number of values returned. Otherwise you will get an error message.</p>

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
HTTP Specific	
Timeout (Sec.)	Enter a timeout in seconds for the HTTP request. If the reply takes longer than this value the request is aborted and an error message is triggered. The maximum value is <b>900</b> seconds (15 minutes).
Script URL	Please enter the URL the sensor will connect to. It has to be <b>URL encoded</b> ! If you enter an absolute URL, this address will be independent from the <b>IP address/DNS name</b> setting of the device this sensor is created on. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section <b>Smart URL Replacement</b> below.
Value Type	The kind of values the HTML file gives back. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
SSL Specific	
SSL Method	<p>This setting is relevant only when using https in the <b>URL</b> field. We recommend using the default value. If you experience connection problems, please select another SSL method from the list. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>SSL V2</b></li> <li>▪ <b>SSL V2 or V3</b>: This is the default setting.</li> <li>▪ <b>SSL V3</b></li> </ul>

SSL Specific	
	<ul style="list-style-type: none"> <li>▪ <b>TLS V1</b></li> </ul> <p><b>Note:</b> Other TLS versions are not supported.</p>

**Note:** This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

Advanced Sensor Data	
Content Changes	<p>Define what will be done in case the content of the monitored web page changes. You can choose between:</p> <ul style="list-style-type: none"> <li>• <b>Ignore changes:</b> No action will be taken on change.</li> <li>• <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that the web page content has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a><sup>[1716]</sup> whenever the web page content changes.</li> </ul>
Sensor Result	<p>Define what will be done with the results the sensor receives. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor (ID).txt"):</b> Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>[2074]</sup> section.</li> </ul>

Authentication	
Authentication	<p>Define if the web page at the configured URL need authentication. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No authentication needed</b></li> <li>▪ <b>Web page needs authentication</b></li> </ul>
User	This field is only visible if authentication is enabled above. Enter a username. Please enter a string.
Password	This field is only visible if authentication is enabled above. Enter a password. Please enter a string.

Authentication	
Authentication Method	<p>This field is only visible if authentication is enabled above. Please select the authentication method the given URL is protected with. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Basic access authentication (HTTP):</b> Use simple HTTP authentication. This is the default setting and suitable for most cases. <b>Note:</b> This authentication method will transmit credentials as plain text!</li> <li>• <b>Windows NT LAN Manager (NTLM):</b> Use the Microsoft NTLM protocol for authentication. This is sometimes used in Intranets for single sign-on.</li> </ul> <p>We recommend using the default value.</p>
Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

### Example

At the URL <http://www.example.com/status.html> a PHP script is giving back the current system status in a simple HTML page, as follows:

```
<html>
<body>
  Description: Script gives back current status of disk free (%) and CPU usage (%).
  [85.5][12.0]
</body>
</html>
```

You would configure the HTTP Content sensor using the mentioned script **URL**, value type **Float**, and number of channels **2**. The sensor will call the URL with every scanning interval and only regard the two values in square brackets **[ ]**, handling each of them in one sensor channel. The additional description text and HTML tags are not necessary; in this example they are added in case a human calls the URL.

**Note:** If you define the number of channels as **1**, only the first value will be read by the sensor; the second value will be ignored. Using **3** as number of channels will result in a sensor error message.

### Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) <sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Proxy Settings for HTTP Sensors**

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. <b>Note:</b> This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see <a href="#">System Administration—Core &amp; Probes</a> <sup>1849</sup> .
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.

**Scanning Interval**

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

## Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either [http:///](#) or [https:///](#) or even a simple slash [/](#) as equivalent for [http:///](#)). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** [www.example.com](#) and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value [https:///](#) in the URL field, PRTG will automatically create the URL [https://www.example.com/](#) from that.
- Using the value [/help](#) in the URL field, PRTG will automatically create and monitor the URL [http://www.example.com/help](#)
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, [http://:8080/](#)

**Note:** Smart URL replacement does not work for sensors running on the "Probe Device".

## More

Knowledge Base article: How can I monitor internal values of a web application with PRTG?

- <http://kb.paessler.com/en/topic/4>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.34 HTTP Full Web Page Sensor

The HTTP Full Web Page sensor monitors the full download time of a web page including assets such as images etc. In the background, it opens the web page in a browser instance to perform the measurement. Links are not followed. The sensor shows the loading time of the full page. **Note:** Be careful with this sensor, as it can generate considerable internet traffic if used with a low scanning interval!

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Full Page Download Settings	
Timeout (Sec.)	Enter a timeout in seconds for the HTTP request. If the reply takes longer than this value the request is aborted and an error message is triggered. The maximum value is <b>900</b> seconds (15 minutes).
URL	Please enter the URL the sensor will load. It has to be <b>URL encoded</b> ! If you enter an absolute URL, this address will be independent from the <b>IP address/DNS name</b> setting of the device this sensor is created on. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section <b>Smart URL Replacement</b> below.
Browser Engine	<p>Define which browser will be used to load the web page. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Chromium (recommended):</b> Use the "WebKit" engine that is delivered with PRTG to perform the loading test. With each scanning interval, PRTG will load the URL defined above in an instance of "Chromium" and measure the time until the page is fully loaded. This is the recommended setting.</li> <li>▪ <b>PhantomJS (Headless Webkit):</b> Use the "PhantomJS" engine. This engine can have a high impact on your probe system's CPU and memory load, but there are additional options for result handling available (see below).</li> <li>▪ <b>Internet Explorer:</b> With each scanning interval, the URL defined above is loaded in the background in an instance of Internet Explorer. PRTG uses the Internet Explorer of the system running the PRTG probe. <b>Note:</b> For full functionality we strongly recommend installing Internet Explorer 8 or higher on the system running the PRTG probe. The probe machine is either the local system (on every node, if on a cluster probe), or the system running the <a href="#">remote probe</a> on which the sensor is created on.</li> </ul> <p><b>Note:</b> For all browser engines, the same proxy settings are used that are configured for the Windows user account the PRTG probe is running on (this is usually the Windows local "system" user account, if not changed). Those settings are accessible via the Internet Explorer of this system. If you want to e.g. use a proxy for this full web page sensor test, please adjust the Internet Explorer's settings accordingly (on the computer running the probe; on all nodes, if in a cluster).</p>
Security Context	<p>Define the Windows user account that will be used to run the browser engine. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use security context of probe service (default):</b> Run the browser engine under the same Windows user account the probe is running on. By default, this is the local Windows "system" user account (if not manually changed).</li> </ul>

### Full Page Download Settings

	<ul style="list-style-type: none"> <li>▪ <b>Use Windows credentials of parent device:</b> Use the Windows user account defined in the settings of the parent device this sensor is created on. Please go to the sensor's parent device's settings to change the Windows credentials. <b>Note:</b> When using the Chromium browser engine above, this is the recommended setting here.</li> </ul>
Result Handling	<p>This setting is only visible if the PhantomJS engine is selected above. This browser engine can render and store screenshots of the loaded web page. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard loaded web page (recommended):</b> Do not store the requested web page.</li> <li>▪ <b>Store latest screenshot of the web page:</b> Render and store the last result of the web page to the "Logs (Sensors)" directory (on the remote system, when used on a remote probe; on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. It will be named after the pattern "Fullpage of Sensor (ID).jpg". For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>[2074]</sup> section.</li> <li>▪ <b>Store ongoing screenshots of the web page (use with caution!):</b> Render and store one new screenshot of the web page with each sensor scan, and store the pictures in the "Screenshots (Fullpage Sensor)" directory (on the remote system, when used on a remote probe). For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>[2074]</sup> section. This option can be used to create a visual history of the web page. <b>Note:</b> Depending on the monitored website and the scanning interval of the sensor, a very high amount of data can be created! Use with care, and make sure you set appropriate data purging limits in the <a href="#">System Administration—Core &amp; Probes</a><sup>[1852]</sup> settings.</li> </ul> <p><b>Note:</b> If necessary, you can change the window size of the rendered screenshots. See section <a href="#">More</a><sup>[534]</sup> for details.</p>
Authentication	<p>This setting is only visible if the PhantomJS engine is selected above. Define if the monitored web page needs authentication for access. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No authentication needed:</b> Access to the web page is granted without authentication.</li> <li>▪ <b>Web page needs authentication:</b> PRTG will automatically try using HTTP Basic authentication (BA) or Windows NT LAN Manager (NTLM) to access the web page with authentication. Enter the credentials below. <b>Note:</b> The option <b>basic access authentication</b> will forward the credentials in plain text!</li> </ul>

**Full Page Download Settings**

User	This setting is only visible if the PhantomJS engine with authentication is selected above. Enter the user name for the web page.
Password	This setting is only visible if the PhantomJS engine with authentication is selected above. Enter the password for the web page.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval**

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<ul style="list-style-type: none"> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

## Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either **http:///** or **https:///** or even a simple slash **/** as equivalent for **http:///**). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** **www.example.com** and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value **https:///** in the URL field, PRTG will automatically create the URL **https://www.example.com/** from that.
- Using the value **/help** in the URL field, PRTG will automatically create and monitor the URL **http://www.example.com/help**
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, **http://:8080/**

**Note:** Smart URL replacement does not work for sensors running on the "Probe Device".

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.35 HTTP Push Count Sensor

The HTTP Push Count sensor counts received messages which are pushed via an Hypertext Transfer Protocol (HTTP) request to the PRTG server. It provides a URL that can be used to push messages to the PRTG server using HTTP.

This function is known as **webhook**. Basically, a webhook works like a **push notification**: Webhooks are usually triggered by some event (for example, a new comment to a blog post) and send according information to a specified URL. The HTTP Push Count sensor then displays the number of pushed and received messages.

Use the following URL to receive the HTTP requests of the webhook:

**http://<probe\_ip>:<port\_number>/<token>**

Replace the parameters **<probe\_ip>**, **<port\_number>**, and **<token>** with the corresponding values. You can define port number and identification token in the sensor settings; the "probe IP" is the IP address of the system your PRTG probe with the sensor is running on.

Example: `http://127.0.0.1:5050/XYZ123`

**Note:** You can use several sensors with the same port and identification token. In this case, the number of push messages will be shown in each of these sensors.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

##### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
-------------	-------------------------------------------------------------------------------------------------------------------------

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
HTTP Push	
Request Method	Select the request method of your webhook: <ul style="list-style-type: none"> <li>▪ <b>ANY:</b> Do not use any filter for the request method.</li> <li>▪ <b>GET:</b> Choose this method if your webhook uses GET.</li> <li>▪ <b>POST:</b> Choose this method if your webhook sends post form data.</li> </ul>
Port	Enter the port number on which this sensor listens for incoming HTTP requests. Default is 5050.
Identification Token	This is the token that is used to find the matching sensor for the incoming message. While you create the sensor, this token is <code>{__guid__}</code> . It will be replaced with an automatically generated token after you have completed the sensor creation. If you want to use another identification token, you can edit it while or after sensor creation. <b>Note:</b> The token will not be replaced automatically if you change it already during sensor creation.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.36 HTTP Push Data Sensor

The HTTP Push Data sensor displays data from received messages which are pushed via an Hypertext Transfer Protocol (HTTP) request to the PRTG server. It provides a URL that can be used to push messages to the PRTG server using HTTP.

This function is known as **webhook**. Basically, a webhook works like a **push notification**: Webhooks are usually triggered by some event (for example, a new comment to a blog post) and send according information to a specified URL. The HTTP Push Data sensor then displays the data of pushed and received messages.

Use the following URL to receive the HTTP requests of the webhook:

**http://<probe\_ip>:<port\_number>/<token>?value=<integer\_or\_float>&text=<text message>**

Replace the parameters **<probe\_ip>**, **<port\_number>**, **<token>**, and **<integer\_or\_float>** with the corresponding values. The **&text** parameter is optional: You can omit it.

- You can define **port number** and **identification token** in the sensor settings.
- The **probe IP** is the IP address of the system on which your PRTG probe with this sensor is running on.
- The **value** can be an integer or a float value, depending on the data of your application; you have to set the value type accordingly in the sensor settings. This parameter will be the sensor value.  
**Note:** If this parameter is missing, the sensor status will be set into a **down** status.
- You can **optionally** add a custom text message by replacing the parameter **<text message>** with it. The text will be shown as sensor message. If there is no value but only a text, the text will be shown as error message.  
**Note:** This text message has to be URL encoded (for example, the whitespaces in the sample URL below); most browsers achieve this automatically.

Example:

```
http://127.0.0.1:5050/XYZ123?value=0&text=this%20is%20a%20message
```

**Note:** You can use several sensors with the same port and identification token. In this case, the data of push messages will be shown in each of these sensors.

**Important notice:** Currently, this sensor type is in **beta** status. The methods of operating can change at any time, as well as the available settings. **Do not expect** that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

HTTP Push	
Request Method	<p>Select the request method of your webhook:</p> <ul style="list-style-type: none"> <li>▪ <b>ANY:</b> Do not use any filter for the request method.</li> <li>▪ <b>GET:</b> Choose this method if your webhook uses GET.</li> <li>▪ <b>POST:</b> Choose this method if your webhook sends post form data.</li> </ul>
Port	Enter the port number on which this sensor listens for incoming HTTP requests. Default is <b>5050</b> .
Identification Token	<p>This is the token that is used to find the matching sensor for the incoming message. While you create the sensor, this token is <code>{_guid_}</code>. It will be replaced with an automatically generated token after you have completed the sensor creation. If you want to use another identification token, you can edit it while or after sensor creation. <b>Note:</b> The token will not be replaced automatically if you change it already during sensor creation.</p>

HTTP Push Data	
No Incoming Data	<p>Define which status the sensor will attain if no push message has been received for at least two sensor scans. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore and keep last status (default):</b> The sensor will remain in the status as defined by the last message received.</li> <li>▪ <b>Switch to "Unknown" status:</b> The sensor will turn into the <b>Unknown</b> status if there has not been received any message for at least two sensor scans.</li> </ul>
Value Type	<p>Define which type the value of the received data has. If this setting does not match, the sensor will go into an <b>Error</b> status. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Integer</b></li> <li>▪ <b>Float</b> (with dot "." as delimiter)</li> </ul>

Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>

Sensor Display	
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>

Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>159</sup> to choose an object on which the current sensor will be dependent on.</p>

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.37 HTTP Push Data Advanced Sensor

The HTTP Push Data Advanced sensor displays data from received messages which are pushed via an Hypertext Transfer Protocol (HTTP) request to the PRTG server. It provides a URL that can be used to push messages to the PRTG server using HTTP. It can show pushed values in multiple channels.

This function is known as **webhook**. Basically, a webhook works like a **push notification**: Webhooks are usually triggered by some event (for example, a new comment to a blog post) and send according information to a specified URL. The HTTP Push Data Advanced sensor then displays the data of pushed and received messages.

The data which is pushed to this sensor must be valid XML. For details about the return value format please see the [Application Programming Interface \(API\) Definition](#)<sup>[2031]</sup>.

Use the following URLs to receive the HTTP requests of the webhook:

- **GET requests:** `http://<probe_ip>:<port_number>/<token>?content=<valid XML>`

The XML encoded value of the content parameter has to match the format as defined in the [API documentation](#)<sup>[2031]</sup> in section **Custom Sensors—Advanced EXE/Script Sensor, Advanced SSH Script Sensor, and Advanced HTTP Push Data Sensor**.

- **POST requests:** `http://<probe_ip>:<port_number>/<token>`

This HTTP request method sends the XML encoded HTTP body as POST data. The body has to match the format as defined in the [API documentation](#)<sup>[2031]</sup> in section **Custom Sensors—Advanced EXE/Script Sensor, Advanced SSH Script Sensor, and Advanced HTTP Push Data Sensor**. We strongly recommend the HTTP content type **application/xml**.

Replace the parameters **<probe\_ip>**, **<port\_number>**, **<token>** and **<valid XML>** (for GET requests) with the corresponding values:

- You can define **port number** and **identification token** in the sensor settings.
- The **probe IP** is the IP address of the system on which your PRTG probe with this sensor is running on.
- The content of GET requests has to be valid XML in the PRTG API format.  
**Note:** The content has to be URL encoded (for example, the whitespaces in the sample URL below); most browsers achieve this automatically.

**Minimum example for the GET method** which returns one static channel value:

```
http://127.0.0.1:5050/XYZ123?content=<prtg><result><channel>MyChannel</channel><value>10</value></prtg>
```

**Note:** You can use several sensors with the same port and identification token. In this case, the data of push messages will be shown in each of these sensors.

**Important notice:** Currently, this sensor type is in **beta** status. The methods of operating can change at any time, as well as the available settings. **Do not expect** that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

HTTP Push	
Request Method	<p>Select the request method of your webhook:</p> <ul style="list-style-type: none"> <li>▪ <b>ANY:</b> Do not use any filter for the request method.</li> <li>▪ <b>GET:</b> Choose this method if your webhook uses GET.</li> <li>▪ <b>POST:</b> Choose this method if your webhook sends post form data.</li> </ul>
Port	Enter the port number on which this sensor listens for incoming HTTP requests. Default is <b>5050</b> .
Identification Token	<p>This is the token that is used to find the matching sensor for the incoming message. While you create the sensor, this token is <code>{_guid_}</code>. It will be replaced with an automatically generated token after you have completed the sensor creation. If you want to use another identification token, you can edit it while or after sensor creation. <b>Note:</b> The token will not be replaced automatically if you change it already during sensor creation.</p>

HTTP Push Data	
No Incoming Data	<p>Define which status the sensor will attain if no push message has been received for at least two sensor scans. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore and keep last status (default):</b> The sensor will remain in the status as defined by the last message received.</li> <li>▪ <b>Switch to "Unknown" status:</b> The sensor will turn into the <b>Unknown</b> status if there has not been received any message for at least two sensor scans.</li> </ul>

Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

### Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.38 HTTP SSL Certificate Expiry Sensor

The HTTP SSL Certificate Expiry Sensor checks a specific https-URL and returns the number of days remaining until the site's SSL certificate expires. It shows a **Warning** when only 60 days are left, and an **Error** status when only 30 days are remaining until the certificate expires.

**Note:** This sensor does not work on probes running on Windows Server 2003 (including SP1 and SP2).

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

#### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

##### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
-------------	-------------------------------------------------------------------------------------------------------------------------

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
URL	Enter the absolute URL to check (this sensor does <b>not</b> use the <b>IP Address/DNS value</b> of the parent device). It has to be <b>URL encoded</b> !
SSLv3 Connection	Define if you want to allow SSLv3 only for connections to the URL configured above. Choose between: <ul style="list-style-type: none"><li>▪ <b>Use SSLv3 if available</b></li><li>▪ <b>Force usage of SSLv3</b></li></ul>
Certificate Name Validation	Define if you want to check if the defined URL matches the certificate. Choose between: <ul style="list-style-type: none"><li>▪ <b>The certificate must match the DNS name</b></li><li>▪ <b>Accept any certificate</b></li></ul>

Proxy Settings for HTTP Sensors	
HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. <b>Note:</b> This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see <a href="#">System Administration—Core &amp; Probes</a>  .
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a>  settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

Schedules, Dependencies, and Maintenance Window	
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#) <sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#) <sup>94</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#) <sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#) <sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#) <sup>142</sup> section.

### 6.8.39 HTTP Transaction Sensor

The HTTP Transaction sensor monitors an interactive website, such as a web shop, by performing a transaction using a set of Hypertext Transfer Protocol (HTTP) URLs. The sensor monitors whether logins or shopping carts work properly. It returns the loading time.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
HTTP Specific	
Timeout (Sec.)	Enter a timeout in seconds for all HTTP requests. If the complete transaction takes longer than this value the request is aborted and an error message is triggered. The maximum value is <b>900</b> seconds (15 minutes).

HTTP Specific	
Single URL Timeout (Sec.)	Enter a timeout in seconds for one single HTTP request. If the reply of any single request takes longer than this value the transaction is aborted and an error message is triggered. The maximum value is <b>900</b> seconds (15 minutes).
HTTP Engine	
Monitoring Engine	<p>If you encounter unexpected errors with the standard method that is used to monitor an URL, try to use the compatibility mode which is based on <b>.Net</b> (introduced in PRTG v13.x.7). Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Default/High Performance (recommended):</b> This is the default monitoring method for this sensor type.</li> <li>▪ <b>Alternate/Compatibility Mode:</b> Try this method as an alternative for websites that do not work with the default approach. Using the compatibility mode, this sensor will execute an external <b>exe</b>. Thus, this method will need more resources, but it can be helpful in particular cases. <b>Note:</b> If you select the compatibility mode, the options for the SSL method will be slightly different. You can also check for trusted certificates. Please see below.</li> </ul> <p><b>Note:</b> When using the Compatibility Mode, <b>Smart URL Replacement</b> will not work, i.e., this sensor does <b>not</b> use the <b>IP Address/DNS value</b> of the parent device automatically then.</p>
SSL Specific	
SSL Method	<p>This setting is relevant only when using https in the <b>URL</b> field. We recommend using the default value. If you experience connection problems, please select another SSL method from the list. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>SSL V2</b></li> <li>▪ <b>SSL V2 or V3:</b> This is the default setting.</li> <li>▪ <b>SSL V3</b></li> <li>▪ <b>TLS V1</b></li> </ul> <p><b>Note:</b> Other TLS versions are not supported.</p>

SSL Specific (when using Compatibility Mode)	
SSL Method	<p>When using the compatibility mode, the SSL specific settings are a bit different to the default SSL settings. SSL V2 is not available. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>SSL V3</b></li> <li>▪ <b>TLS V1</b></li> <li>▪ <b>SSL V3 or TLS V1</b>: This is the default setting.</li> </ul>
Check SSL Certificates	<p>Specify if the certificate of the monitored URL will be checked. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Do not check used certificates</b>: This the default setting.</li> <li>▪ <b>Check if the used certificates are trusted</b>: If the certificate of the server is not trusted, the sensor will go into a <b>Down</b> status and display a corresponding message.</li> </ul>

**Note:** This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

Advanced Sensor Data	
Limit Download (kb)	<p>Enter a maximum amount of data that will be transferred per every single request. If you set content checks below, please be aware that only the content downloaded within this limit can be checked for certain search expressions.</p>
Cookie Management	<p>Select if cookies will be used for the transaction. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Use cookies (recommended)</b>: Allow cookies to be set and read during the transaction cycle.</li> <li>• <b>Ignore cookies</b>: Do not allow cookies. Use this option if you want to test the transaction without the use of cookies.</li> </ul> <p>We recommend using the default value.</p>
Result Handling	<p>Define what will be done with the web page loaded at the given URL. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Discard HTML result</b>: Do not store the requested web page.</li> <li>• <b>Store latest HTML result</b>: Store the last result of the requested web page to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes, especially in combination with content checks. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>

Authentication	
Authentication	<p>Define if the web page at the configured URL need authentication. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No authentication needed</b></li> <li>▪ <b>Web page needs authentication</b></li> </ul>
User	This field is only visible if authentication is enabled above. Enter a username. Please enter a string.
Password	This field is only visible if authentication is enabled above. Enter a password. Please enter a string.
Authentication Method	<p>This field is only visible if authentication is enabled above. Please select the authentication method the given URL is protected with. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Basic access authentication (HTTP):</b> Use simple HTTP authentication. This is the default setting and suitable for most cases. <b>Note:</b> This authentication method will transmit credentials as plain text!</li> <li>• <b>Windows NT LAN Manager (NTLM):</b> Use the Microsoft NTLM protocol for authentication. This is sometimes used in Intranets for single sign-on.</li> </ul> <p>We recommend using the default value.</p>

Transaction URL	
<p>You can define up to 10 different transaction URLs which will all be called in a row. Only if the complete transaction can be completed, the sensor will be in an <b>Up status</b><sup>121)</sup>. Using this mechanism you can set up an extended monitoring with multiple URLs. Please enter settings for at least one transaction URL. You can use as many steps as needed and disable the other steps.</p>	
Transaction Step #x	<p>This setting is available for URL #2 through #10. Define if you want to use this step for your transaction check. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Disable step #x:</b> Do not use this step. Choose this option if you do not need all 10 steps for your transaction check.</li> <li>▪ <b>Enable step #x:</b> Enable this step. Further options will be viewed, as described below.</li> </ul>

Transaction URL	
URL	Please enter the URL the sensor will connect to. It has to be <b>URL encoded</b> ! If you enter an absolute URL, this address will be independent from the <b>IP address/DNS name</b> setting of the device this sensor is created on. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section <b>Smart URL Replacement</b> below.
Request Method	<p>The request method determines how the given URL is requested.</p> <ul style="list-style-type: none"> <li>• <b>GET</b>: Request the website directly, like browsing the web. We recommend using this setting for a simple check of a web page.</li> <li>• <b>POST</b>: Send post form data to the URL. If this setting is chosen, you must enter the data that will be sent in the <b>Postdata</b> field below.</li> <li>• <b>HEAD</b>: Only request the HTTP header from the server; without the actual web page. Although this saves bandwidth since less data is transferred, it is not recommended because the measured request time is not the one experienced by your users and you might not be notified for slow results or timeouts.</li> </ul>
Postdata	This field is only active when POST is selected in the <b>Request Method</b> setting above. Please enter the data part for the post request here. <b>Note</b> : No XML is allowed here!
Check For Existing Key Words (Positive)	<p>Define whether the result at the configured URL will be checked for keywords. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Disable</b>: Do not search for keywords.</li> <li>▪ <b>Enable key word check (positive)</b>: In the result returned at the URL, check if a key word exists.</li> </ul> <p><b>Note</b>: The content check is only intended for html websites and might not work with other target URLs.</p>
Response Must Include	Define which string must be part of the web at the given URL. If the data does not include this string, the sensor will be set to an error state. Please enter a string. <b>Note</b> : Only simple text search is available here. The characters <b>*</b> and <b>?</b> work here as placeholder, whereas <b>*</b> stands for no or any number of characters and <b>?</b> stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible.
Check For Existing Key Words (Negative)	<p>Define whether the the result at the configured URL will be checked for keywords. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Disable</b>: Do not search for keywords.</li> </ul>

Transaction URL	
	<ul style="list-style-type: none"> <li>▪ <b>Enable key word check (negative):</b> In the result returned at the URL, check if a key word does not exist.</li> </ul> <p><b>Note:</b> The content check is only intended for html websites and might not work with other target URLs.</p>
Response Must Not Include	<p>Define which string must not be part of the web at the given URL. If the data does include this string, the sensor will be set to an error state. Please enter a string. <b>Note:</b> Only simple text search is available here. The characters <b>*</b> and <b>?</b> work here as placeholder, whereas <b>*</b> stands for no or any number of characters and <b>?</b> stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Proxy Settings for HTTP Sensors	
HTTP Proxy Settings	<p>The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. <b>Note:</b> This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see <a href="#">System Administration—Core &amp; Probes</a><sup>1849</sup>.</p>
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. <b>Note:</b> Only basic authentication is available! Please enter a string or leave the field empty.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

## Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

## Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either **http:///** or **https:///** or even a simple slash **/** as equivalent for **http:///**). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** **www.example.com** and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value **https:///** in the URL field, PRTG will automatically create the URL **https://www.example.com/** from that.
- Using the value **/help** in the URL field, PRTG will automatically create and monitor the URL **http://www.example.com/help**
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, **http://:8080/**

**Note:** Smart URL replacement does not work for sensors running on the "Probe Device".

Knowledge Base: Configuration Tips for HTTP Transaction Sensors needed

- <http://kb.paessler.com/en/topic/443>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.40 HTTP XML/REST Value Sensor

The HTTP XML/REST Value sensor retrieves an XML file from a given URL and parses it. It can return the values of specific nodes.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

### Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
Channel Name	Enter a name for the channel which will display the value at the given URL. The name can be changed later in the <a href="#">Sensor Channels Settings</a> <sup>[1709]</sup> .

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
URL	Enter the absolute URL that returns the XML file (this sensor does <b>not</b> use the <b>IP Address/DNS value</b> of the parent device). It has to be <b>URL encoded</b> !
XML Node (and optional property)	<p>Enter the name of the node this sensor will check, or enter a node name and a property name to check a property value. To obtain a value from nested tags, please enter the tag names separated by a slash symbol, for example, use <b>myTag/myTagInside</b> as XML node value. <b>Note:</b> You can also check values in JavaScript Object Notation (JSON) notation. Please see <a href="#">Checking JSON</a><sup>[579]</sup> section below.</p> <p><b>Note:</b> You can try using XPath syntax here but it will not work in all cases and we do not provide any technical support for XPath issues. For further documentation about XPath please see <a href="#">More</a><sup>[572]</sup> section below.</p>
HTTP Username	If the URL requires authentication, enter the username. Please enter a string or leave the field empty.
HTTP Password	If the URL requires authentication, enter the password. Please enter a string or leave the field empty.
Sensor Value	Choose between:

Sensor Settings	
	<ul style="list-style-type: none"> <li>▪ <b>Use the value of the selected XML node:</b> Return the value found at the specified XML node. If this is non-numeric, this will return 0.</li> <li>▪ <b>Use the number of occurrences of the selected XML node or its children/siblings:</b> Return the number of occurrences found. Define further below.</li> </ul>
Count XML Nodes	<p>This setting is only visible if the return number option is enabled above. Define which count will be returned. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Occurrences of the selected XML node:</b> Return how often the defined XML node occurs at the defined URL.</li> <li>▪ <b>Child nodes of the selected XML node:</b> Return the number of child nodes that exist below the node at the defined URL.</li> <li>▪ <b>Sibling nodes of the selected XML node:</b> Return the number of sibling nodes that exist next to the node at the defined URL.</li> </ul>
Namespaces	<p>Define whether namespaces in the XML document will be used or not. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use Namespaces:</b> Process the value entered in the "XML Node (and optional property)" field including possibly existing namespace information.</li> <li>▪ <b>Remove Namespaces:</b> Ignore namespace information in the XML document and process the value entered in the "XML Node (and optional property)" field as node names only.</li> </ul> <p>For more information see <a href="#">About Namespaces</a><sup>580</sup> section below.</p>
Content Type in Header	<p>Choose if PRTG will include <code>content-type="text/xml"</code> in the header of the request sent to the URL defined above. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Enable (recommended):</b> This works for most web servers and is the recommended setting.</li> <li>▪ <b>Disable:</b> Only very few web servers cannot handle this content-type and need this setting. Try this if you get an error message with the enabled option.</li> <li>▪ <b>Custom:</b> You can use a custom content type.</li> </ul>
Custom Content Type	<p>Only visible when "Custom" is enabled above. Enter a custom content type like <code>text/xml</code> or <code>text/html</code>.</p>

Sensor Settings	
Characters to Remove	Only visible when using value of XML node is enabled above. Optionally enter a string which will be removed from the returned XML value. Use this to remove any unwanted characters from the result, for example, a thousands separator from numeric values. Please enter a string or leave the field empty.
Decimal Delimiter	This setting is only visible if "use value" is enabled above. If the sensor value of the selected XML node is of the type <b>float</b> , you can define any character here which is the decimal delimiter. Enter one character or leave the field empty.
Custom Message	Optionally enter a custom sensor message. Use <b>%1</b> as a placeholder to automatically fill in the returned XML value. Please enter a string or leave the field empty.
Force SSL V3	Define if you only want to allow SSL V3 connections to the URL defined above. Choose between: <ul style="list-style-type: none"> <li>▪ <b>No</b></li> <li>▪ <b>Yes</b></li> </ul>
If Value Changes	Define what shall be done in case the value of this sensor changes. You can choose between: <ul style="list-style-type: none"> <li>• <b>Ignore changes (default):</b> No action will be taken on change.</li> <li>• <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a><sup>1716</sup> whenever the sensor value changes.</li> </ul>
Results	Define what will be done with the results given back. Choose between: <ul style="list-style-type: none"> <li>• <b>Discard result:</b> Do not store the requested web page.</li> <li>• <b>Write result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">More</a><sup>438</sup> section below.</li> </ul>
Unit String	Enter a string that will be added to the values as a unit description. This is for display purposes only.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

### Channel Unit Configuration

#### Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

**Note:** Custom channel types can be set on sensor level only.

### Checking JSON

With the **XML Node (and optional property)** field you can also check values that are returned in JavaScript Object Notation (JSON) notation under the defined URL.

Example

A JSON notated section may look like the following:

```
{
  "test": "Hello World",
  "object": {
    "value": "content",
    "AnotherValue": "AnotherContent"
  },
  "arraytest": [
    "one",
    "two"
  ]
}
```

Depending on your entries in the **XML Node** field, the sensor will process the respective values:

Entry in Sensor's "XML Node" Field (from Example Above)	Processed Value (from Example Above)
test	Hello World
object/value	content
object/AnotherValue	AnotherContent
object	contentAnotherContent
arraytest[1]	one
arraytest[2]	two

About Namespaces

In an XML document, tags may use namespaces.

### Example

A namespace notated section may look like the following:

```
<myNamespace:myNode>  
  some information  
</myNamespace:myNode>
```

If you set this sensor to **Use Namespaces** (this is the default setting), it will expect the full node name, including the namespace information, in the **XML Node (and optional property)** field. In the example above, this would be **myNamespace:myNode**.

If your node names are unique even without the namespace information, you can simplify the settings by setting this sensor to **Remove Namespaces**. The sensor will then expect the node name only in the **XML Node (and optional property)** field. In the example above, this would be **myNode**.

### Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#) <sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.41 Hyper-V Cluster Shared Volume Disk Free Sensor

The Hyper-V Cluster Shared Volume Disk Free sensor monitors a Microsoft Hyper-V cluster shared volume via PowerShell and shows the available disk space. **Note:** The parent device for this sensor must be a Windows Server running Hyper-V.

**Note:** We recommend using System Center Virtual Machine Manager (SCVMM) as parent device, because this way PRTG will continue to monitor your virtual machines also when they change the physical host using Live Migration.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: Remote PowerShell

The Hyper-V Cluster Shared Volume Disk Free sensor uses PowerShell commands. In order to monitor devices with this sensor **Remote PowerShell** has to be enabled. For detailed information, please see [More](#)<sup>589</sup> section below.

### Requirement: WSFC PowerShell Interface

This sensor type needs the WSFC (Windows Server Failover Clustering) PowerShell Interface to be installed on the target machine. You can list all modules in the PowerShell console with the command **Get-Module -ListAvailable**. Here **FailoverClusters** has to appear. Under Windows 2008 and 2012 the interface is part of the VMM Administrator Console, or the VMM 2012 Management Console, respectively.

The interface is everywhere available where the WSFC feature is installed: Windows Server 2008 R2 (SP1) Full and Core (not installed by default); Microsoft Hyper-V Server 2008 R2 (SP1); Remote Server Administration Tools (RSAT) for Windows 7 (SP1).

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>2050</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor cluster disks, PRTG will create one sensor for each disk. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Disk Free Settings	
Disk	Select the disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head. <b>Note:</b> Please make sure the resource name of your disks do not contain unsupported characters, especially avoid the hash ('#') sign. We recommend to not rename resource disk name once you've set up monitoring. For detailed information, please see <a href="#">More</a> <sup>[602]</sup> section below.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

Basic Sensor Settings	
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Disk Free Settings	
Disk	Shows further information about the disk. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
If Value Changes	<p>Define what will be done in case the value of a sensor channel changes. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore changes:</b> No action will be taken on change.</li> <li>▪ <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <sup>1716</sup> whenever the sensor value changes.</li> </ul>
Sensor Result	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <b>Result of Sensor [ID].txt</b>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.42 Hyper-V Host Server Sensor

The Hyper-V Host Server sensor monitors a Microsoft Hyper-V host server via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device. It shows CPU usage in percent of guests, hypervisor, and total, as well as host health critical values, the number of deposited pages, and network traffic. Network traffic sums up the total bytes per second (received and sent) on all ports of your virtual switch.

**Note:** The parent device for this sensor must be a Windows Server running Hyper-V.

**Note:** We recommend using System Center Virtual Machine Manager (SCVMM) as parent device, because this way PRTG will continue to monitor your virtual machines also when they change the physical host using Live Migration.

**Note:** By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback in case Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. The default behavior can be changed in the **Windows Compatibility Options** of the parent [device's settings](#)<sup>[280]</sup> this sensor is created on.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[280]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

### Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>[2030]</sup>. **Note:** The target system may well run on Windows 2003 or later.

## Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (e.g. via **services.msc**). In the list, find the respective service and set its **Start Type** to **Automatic**.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Sensor Result	Define what will be done with the result of the sensor. Choose between:

	<ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <b>Result of Sensor [ID].txt</b>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) <sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

### Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#) <sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#) <sup>94</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#) <sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#) <sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#) <sup>142</sup> section.

### 6.8.43 Hyper-V Virtual Machine Sensor

The Hyper-V Virtual Machine sensor monitors a virtual machine running on a Microsoft Hyper-V host server, via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device. It shows CPU usage in percent of guests, hypervisor, and total, as well as disk read and write values, per second. **Note:** The parent device for this sensor must be a Hyper-V server.

**Note:** In order to monitor a virtual machine with this sensor, **disable** User Account Control (UAC) in the control panel of the Windows operating system which is running on this virtual machine. Otherwise, the sensor might switch into a down status with the error message "The virtual is not running or is powered off".

**Note:** We recommend using System Center Virtual Machine Manager (SCVMM) as parent device, because this way PRTG will continue to monitor your virtual machines also when they change the physical host using Live Migration.

**Note:** By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback in case Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. The default behavior can be changed in the **Windows Compatibility Options** of the parent [device's settings](#)<sup>[280]</sup> this sensor is created on.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

#### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

#### Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>[2050]</sup>. **Note:** The target system may well run on Windows 2003 or later.

## Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (e.g. via **services.msc**). In the list, find the respective service and set its **Start Type** to **Automatic**.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor virtual machines, PRTG will create one sensor for each machine. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Virtual Machine Settings	
Virtual Machine	Select the virtual machines (VMs) you want to add a sensor for, including the ones that are not running. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head. <b>Note:</b> Please make sure the name of your VMs do not contain unsupported characters, especially avoid the hash ('#') sign. We recommend to not rename virtual machines once you've set up monitoring. For detailed information, please see <a href="#">More</a> <sup>602</sup> section below.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Virtual Machine Settings	
GUID	Shows the Globally Unique Identifier (GUID) of the virtual machine monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the virtual machine monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the host server. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Powered Off VMs	<p>Choose how the sensor will react to a virtual machine that is powered off. Please choose between:</p> <ul style="list-style-type: none"> <li>• <b>Alarm when powered off (default):</b> The sensor will change to a <a href="#">Down</a><sup>[121]</sup> status if the virtual machine is powered off. Note: While in Down status, a sensor does not record any data in all of its channels.</li> <li>• <b>Ignore powered off state:</b> The sensor will not change to a <b>Down</b> status if the virtual machine is powered off; it will report zero values instead.</li> </ul>
Sensor Result	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> </ul>

**Virtual Machine Settings**

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: **Result of Sensor [ID].txt**. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see [Data Storage](#) <sup>2074</sup> section.

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) <sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

## Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>941</sup>.

## More

Knowledge Base: Why don't my Hyper-V Virtual Machine / Network Adapter Sensor work after changing names?

- <http://kb.paessler.com/en/topic/15533>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.44 Hyper-V Virtual Network Adapter Sensor

The Hyper-V Network Adapter sensor monitors virtual network adapters running on a Microsoft Hyper-V host server, via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device. It shows sent and received bytes, packets, broadcast packets, directed packets, and multicast packets, per second. **Note:** The parent device for this sensor must be a Hyper-V server.

**Note:** We recommend using System Center Virtual Machine Manager (SCVMM) as parent device, because this way PRTG will continue to monitor your virtual machines also when they change the physical host using Live Migration.

**Note:** By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback in case Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. The default behavior can be changed in the **Windows Compatibility Options** of the parent [device's settings](#)<sup>[280]</sup> this sensor is created on.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[209]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[199]</sup> section.

### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

### Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>[209]</sup>. **Note:** The target system may well run on Windows 2003 or later.

## Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (e.g. via **services.msc**). In the list, find the respective service and set its **Start Type** to **Automatic**.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor network adapters, PRTG will create one sensor for each adapter. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Virtual Machine Settings	
Hyper-V Virtual Network Adapter	Select the virtual network adapters you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head. <b>Note:</b> We recommend to not rename virtual machines once you have set up monitoring. Renaming them will also change the internal virtual network adapter names, causing the monitoring to be interrupted. For detailed information about virtual machine naming, please see <a href="#">More</a> <sup>[602]</sup> section below.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings**

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Hyper-V Virtual Network Adapter Settings**

Virtual Network Adapter	Shows the name of the virtual network adapter monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	<p>Define what will be done with the results the sensor receives. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>[2014]</sup> section.</li> </ul>

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor.

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>159</sup> to choose an object on which the current sensor will be dependent on.</p>

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

### 6.8.45 Hyper-V Virtual Storage Device Sensor

The Hyper-V Virtual Storage sensor monitors a virtual storage device running on a Microsoft Hyper-V host server, via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device. It shows read and write values in second, and the number of errors. **Note:** The parent device for this sensor must be a Hyper-V server.

**Note:** We recommend using System Center Virtual Machine Manager (SCVMM) as parent device, because this way PRTG will continue to monitor your virtual machines also when they change the physical host using Live Migration.

**Note:** By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback in case Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. The default behavior can be changed in the **Windows Compatibility Options** of the parent [device's settings](#)<sup>[280]</sup> this sensor is created on.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

#### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

#### Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>[2050]</sup>. **Note:** The target system may well run on Windows 2003 or later.

## Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (e.g. via **services.msc**). In the list, find the respective service and set its **Start Type** to **Automatic**.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor storage devices, PRTG will create one sensor for each device. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

### Hyper-V Virtual Storage Device Settings

Hyper-V Virtual Storage Device	Select the virtual storage devices you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.
--------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
-------------	-------------------------------------------------------------------------------------------------------------------------

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Hyper-V Virtual Storage Device Settings	
Virtual Storage Device	Shows the unique name of the device monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <b>Result of Sensor [ID].txt</b>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>[2074]</sup> section.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

### Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.46 IMAP Sensor

The IMAP sensor monitors a mail server using Internet Message Access Protocol (IMAP) and shows the server's response time as well as the number of emails in the defined mailbox. It can also check the content of emails for certain key words. This way, you can use this sensor to monitor backup solutions via emails that are sent out by these solutions. For more information, see section [More](#)<sup>[627]</sup>.

**Note:** If you use content checks, we recommend using a dedicated IMAP account that is only checked by PRTG. Editing existing mails in the mailbox of the monitored IMAP account can lead to false alarms or malfunctions of this sensor type.

**Note:** This sensor type might not work properly when monitoring sub-folders of mailboxes. If it has to check subsequent emails with identical subjects, later on incoming emails might not be recognized.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

IMAP Specific	
Timeout (sec.)	Enter a timeout in seconds for the SMTP connect. If the reply takes longer than this value the request is aborted and an error message is triggered.
Port	Enter the number of the port that will be used to connect via IMAP. For non-secure connections usually port 143 is used; usually port 993 for SSL connections. The actual setting depends on the server you are connecting to. Please enter an integer value. We recommend using the default value. If you do not get a connection, please try another port number.
Authentication	
Authentication Type	<p>Select the kind of authentication for the IMAP connection. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Username/Password:</b> Authenticate at the IMAP server via username and password.</li> <li>• <b>Simple Authentication and Security Layer (SASL):</b> Use a secure connection for the authentication at the IMAP server.</li> </ul>
Username	Enter a username for IMAP authentication. Please enter a string or leave the field empty. <b>Note:</b> If you leave this field empty, PRTG will not attempt to log in to the mail server. The sensor will show a green <b>Up</b> status if the IMAP server is available.
Password	Enter a password for IMAP authentication. Please enter a string or leave the field empty. <b>Note:</b> If you leave this field empty, PRTG will not attempt to log in to the mail server. The sensor will show a green <b>Up</b> status if the IMAP server is available.
TLS (Transport-Level Security)	<p>This setting is only relevant if authentication is used. Choose if a secure connection via TLS/SSL will be used. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Don't use</b></li> <li>• <b>Use</b></li> </ul>

SSL-Method	<p>This field is only visible if security is enabled above. Select the SSL method that will be used when connecting to the server. We recommend using the default value. Only if you experience connection problems, try another setting. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>SSL V2</b></li> <li>▪ <b>SSL V2 or V3</b></li> <li>▪ <b>SSL V3</b></li> <li>▪ <b>TLS V1</b></li> </ul>
<b>Identify Email</b>	
Process Email Content	<p>This sensor can additionally check the content of all incoming emails. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Do not check email content:</b> Only check availability of the IMAP server and check if a login is successful (if defined). Do not process any mails in the IMAP mail account.</li> <li>▪ <b>Process emails in this mailbox:</b> Login in to the IMAP mail account and check the mails contained there. Define further options below.</li> </ul>
Mailbox Name	<p>This field is only visible if email content processing is enabled above. Enter the name of the mailbox (e.g. the name of the IMAP folder) that will be checked. Default value is <b>Inbox</b>. Unless you set a last message date check below, the sensor will always look at <b>all</b> emails contained in the mailbox. <b>Note:</b> Please make sure that you do not manually edit mails in this mailbox with another mail client, as this can lead to malfunctions of this sensor's email identification.</p>
Identify by "From" Field	<p>This option is only visible if email content processing is enabled above. Define if you want to check the "From" field of the emails. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Don't check:</b> Do not check this field in emails.</li> <li>▪ <b>Check using string search:</b> Check this field in emails using simple string search.</li> <li>▪ <b>Check using regular expression:</b> Check this field in emails using a regular expression. For more information about syntax, please see <a href="#">Regular Expressions</a> <sup>2046</sup> section.</li> </ul> <p>When using a search, the sensor will scan all emails from the newest to the oldest. <b>Note:</b> The scan will be finished with the first match! That means: After a match is found in one email, there will be no further checks performed in older emails.</p>
Search For	<p>This field is only visible if a check is enabled above. Enter a search string using the method defined above.</p>

Identify Email	
Identify by "Subject" Field	<p>This option is only visible if email content processing is enabled above. Define if you want to check the "Subject" field of the emails. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Don't check:</b> Do not check this field in emails.</li> <li>▪ <b>Check using string search:</b> Check this field in emails using simple string search.</li> <li>▪ <b>Check using regular expression:</b> Check this field in emails using a regular expression. For more information about syntax, please see <a href="#">Regular Expressions</a> <sup>2048</sup> section.</li> </ul> <p>When using a search, the sensor will scan all emails from the newest to the oldest. <b>Note:</b> The scan will be finished with the first match! That means: After a match is found in one email, there will be no further checks performed in older emails.</p>
Search For	This field is only visible if a check is enabled above. Enter a search string using the method defined above.
Identify by Mail Body	<p>This option is only visible if email content processing is enabled above. Define if you want to check the mail body of the emails. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Don't check:</b> Do not check the mail body.</li> <li>▪ <b>Check using string search:</b> Check the mail body using simple string search.</li> <li>▪ <b>Check using regular expression:</b> Check the mail body using a regular expression. For more information about syntax, please see <a href="#">Regular Expressions</a> <sup>2048</sup> section.</li> </ul> <p>When using a search, the sensor will scan all emails from the newest to the oldest. <b>Note:</b> The scan will be finished with the first match! That means: After a match is found in one email, there will be no further checks performed in older emails.</p>
Search For	This field is only visible if a check is enabled above. Enter a search string using the method defined above.
Check Last Message Date	<p>This option is only visible if email content processing is enabled above. Define if you want to check all emails in the mailbox, or only mails that were received within the last x hours. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Don't check message age:</b> Always check all emails contained in the mailbox.</li> <li>▪ <b>Check for new messages received within the last x hours:</b> Only regard emails that were received in the last hours. Define below.</li> </ul>

Identify Email	
Error Threshold (Hours)	Enter the maximum age in hours. Only emails that are younger will be processed. If there is no matching email in the defined time span, the sensor will show a <b>Down</b> status.
Warning Threshold (Hours)	Enter the maximum age in hours. Only emails that are younger will be processed. If there is no matching email in the defined time span, the sensor will show a <b>Warning</b> status.
Sensor Behavior	
Set to Alarm	<p>This setting is only visible if email content check is enabled above. Define in which cases the sensor will show a <b>Down</b> status. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>If subject contains</b></li> <li>▪ <b>If subject does not contain</b></li> <li>▪ <b>If mail body contains</b></li> <li>▪ <b>If mail body does not contain</b></li> <li>▪ <b>Always:</b> Always set this sensor to a <b>Down</b> status in case any emails could be identified.</li> <li>▪ <b>Never:</b> Never set this sensor to a <b>Down</b> status based on email content.</li> </ul>
Check Method	<p>This setting is only visible if an if-condition is selected above. Define how you want to check for the above condition. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>String search:</b> Check the mail body using simple string search.</li> <li>▪ <b>Regular expression:</b> Check the mail body using a regular expression. For more information about syntax, please see <a href="#">Regular Expressions</a> <small>[2046]</small> section.</li> </ul> <p>When using a search, the sensor will scan all emails from the newest to the oldest. <b>Note:</b> The scan will be finished with the first match! That means: After a match is found in one email, there will be no further checks performed in older emails.</p>
Search Text	This setting is only visible if an if-condition is selected above. Enter a search string using the method defined above.
Error Message	This setting is only visible if an alarm condition is selected above. Define the message that will be shown in case the sensor shows a <b>Down</b> status.

Sensor Behavior	
Set to Warning	<p>This setting is only visible if email content check is enabled above. Define in which cases the sensor will show a <b>Warning</b> status. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>If subject contains</b></li> <li>▪ <b>If subject does not contain</b></li> <li>▪ <b>If mail body contains</b></li> <li>▪ <b>If mail body does not contain</b></li> <li>▪ <b>Always:</b> Always set this sensor to a <b>Warning</b> status in case any emails could be identified.</li> <li>▪ <b>Never:</b> Never set this sensor to a <b>Warning</b> status based on email content.</li> </ul>
Check Method	<p>This setting is only visible if an if-condition is selected above. Define how you want to check for the above condition. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>String search:</b> Check the mail body using simple string search.</li> <li>▪ <b>Regular expression:</b> Check the mail body using a regular expression. For more information about syntax, please see <a href="#">Regular Expressions</a> <small>[2048]</small> section.</li> </ul> <p>When using a search, the sensor will scan all emails from the newest to the oldest. <b>Note:</b> The scan will be finished with the first match! That means: After a match is found in one email, there will be no further checks performed in older emails.</p>
Search Text	<p>This setting is only visible if an if-condition is selected above. Enter a search string using the method defined above.</p>
Warning Message	<p>This setting is only visible if a warning condition is selected above. Define the message that will be shown in case the sensor shows a <b>Warning</b> status.</p>
No Matching Mail Behavior	<p>This setting is only visible if email content check is enabled above. Define how the sensor will react if no matching emails are found in the mailbox that is being scanned. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Set sensor to "Down" status</b></li> <li>▪ <b>Set sensor to "Warning" status</b></li> <li>▪ <b>None:</b> Don't do anything in this case.</li> </ul>

Sensor Behavior	
Message	This field is only effective if a sensor change in case of no matching mail is defined above. Define the message that will be shown in case the sensor could not find any matching emails. It will be shown together with a <b>Warning</b> or <b>Down</b> status, just as defined above.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#) <sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#) <sup>941</sup>.

## More

Knowledge Base: How can I monitor my backup software to be sure backup succeeded last night?

- <http://kb.paessler.com/en/topic/47023>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#) <sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#) <sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.47 INI File Content Check Sensor

The INI File Content Check sensor reads an \*.ini file. It indicates if the file exists and if a specified section and field are found. The sensor returns the field's integer value (or -1 if the field does not contain an integer). It will show a **Warning** status if a section or field is not found, and a **Down** status if the file could not be opened.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
INI File Name	Enter the full path to the file this sensor will monitor. For example, enter <b>C:\Windows\win.ini</b> . If the file is located on a network device use the Uniform Naming Convention (UNC) path <b>without</b> the server part (you would only enter <b>share\folder\file.ini</b> ). The server part ( <b>\server\</b> ) is taken from this sensor's parent device's settings. Please enter a valid path and file name. <b>Note:</b> In order to provide any shares, the <b>LanmanServer</b> "Server" Windows service must be running on the target computer.
INI Section	Define the section inside the INI file you would like to check. A section within the INI file is denoted in square brackets <b>[ ]</b> . Enter the section name without the brackets here, for example, enter <b>Mail</b> . This value is not case sensitive. If the section is not found, the sensor will show a <b>Warning</b> status.
INI Field	Define the field inside the section you would like to check. In the INI file, a field name is written before an equal sign <b>=</b> , followed by its value. Enter the field name here, for example, enter <b>MAPI</b> . This value is not case sensitive. The sensor will return the value of this field, i.e. the value on the right side of the equal sign. If the field is not found, the sensor will show a <b>Warning</b> status.
If Value Changes	Define what will be done in case the value of this sensor changes. You can choose between: <ul style="list-style-type: none"> <li>• <b>Ignore changes:</b> No action will be taken on change.</li> <li>• <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <small>1716</small> whenever the sensor value changes.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.48 IP on DNS Blacklist Sensor

The IP on DNS Blacklist sensor checks if the IP address of its parent device is listed on specific blacklist servers and returns the number of hits found. If a DNS name is used as the parent device's hostname, PRTG will resolve it to an IP address first.

During normal operation, there should be **0** hits and the sensor should show a green **Up** status. If the IP address is found on at least one of the blacklist servers, the sensor changes to a yellow **Warning** status by default. **Note:** You can set additional thresholds in the sensor's [Sensor Channels Settings](#)<sup>[1709]</sup>, if you like.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 2.0.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
-------------	-------------------------------------------------------------------------------------------------------------------------

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[639]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
Blacklist Servers	Define the blacklist servers that will be used for the check. You can enter a comma separated list. Default is <b>bl.spamcop.net</b> . For a list of servers, please see <a href="#">More</a> <sup>[639]</sup> section below. <b>Note:</b> With each scanning interval, PRTG will query all servers in the list! We recommend you do not enter more than 10 servers to make sure the check can be completed within the scanning interval of this sensor. If you use too many blacklist servers, the sensor will show a "Timeout (code: PE018)" error message.
Timeout (sec.)	Define a timeout in seconds for the check. If the reply takes longer than this value the request is aborted and an error message is triggered.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**More**

- <http://kb.paessler.com/en/topic/37633>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.49 IPFIX Sensor

The IPFIX sensor receives traffic data from an IPFIX (Internet Protocol Flow Information Export) compatible device and shows traffic by type. There are several filter options available to divide traffic into different channels. Please make sure your device supports IPFIX when using this sensor.

**Note:** In order for this sensor to work, you have to enable IPFIX export on the device. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe). This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

For a general introduction to the technology behind flow monitoring, please see [Monitoring Bandwidth via Flows](#)<sup>[196]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

IPFIX Specific Settings	
Receive IPFIX Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the IPFIX export options of your hardware router device. Please enter an integer value.
Sender IP	Enter the IP address of the sending device you want to receive the IPFIX data from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive IPFIX Packets on IP	Select the IP address(es) on which PRTG listens to IPFIX packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line or in the top level box to select all. The IP address selected here must match the one configured in the IPFIX export options of your hardware router device.
Active Flow Timeout (Minutes)	Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data is received, the sensor may switch to an <b>Unknown</b> status. Please enter an integer value. We recommend setting this one minute longer than the respective timeout configured in your hardware router device. <b>Note:</b> If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Off:</b> The standard flow will be used.</li> <li>▪ <b>On:</b> Switch into sampling mode and specify the sampling rate below.</li> </ul>
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your exporter device. If the number is different, monitoring results will be incorrect. Please enter an integer value.
Log Stream Data to Disk (for Debugging)	Define if the probe will write a log file of the stream and packet data to the data folder (see <a href="#">Data Storage</a> <sup>2074</sup> ). Choose between: <ul style="list-style-type: none"> <li>▪ <b>None (recommended):</b> Do not write additional log files. Recommended for normal use cases.</li> <li>▪ <b>Only for the 'Other' channel:</b> Only write log files of data that is not filtered otherwise and therefore accounted to the default <b>Other</b> channel.</li> <li>▪ <b>All stream data:</b> Write log files for all data received.</li> </ul>

**IPFIX Specific Settings**

**Note:** Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

**Channel Configuration****Channel Selection**

Define the categories the traffic will be accounted to. There are different groups of traffic available. Choose between:

- **Web:** Internet web traffic.
- **File Transfer:** Traffic caused by FTP.
- **Mail:** Internet mail traffic.
- **Chat:** Traffic caused by chat and instant messaging.
- **Remote Control:** Traffic caused by remote control applications, such as RDP, SSH, Telnet, VNC.
- **Infrastructure:** Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, SNMP.
- **NetBIOS:** Traffic caused by NetBIOS communication.
- **Other Protocols:** Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, i.e. how detailed traffic will be divided. For each group, choose between:

- **No:** Do not account traffic of this group in an own channel. All traffic of this group will be accounted to the default channel named **Other**.
- **Yes:** Count all traffic of this group and summarize it into one channel.
- **Detail:** Count all traffic of this group and further divide it into different channels. The traffic will appear in several channels as shown in the **Content** column. **Note:** Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

**Note:** You can change the default configuration for groups and channels. For details, please see section **More**.

Filtering	
Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>[2032]</sup> section.
Exclude Filter	First, the filters defined in the <b>Include Filter</b> field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>[2032]</sup> section.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1700]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Primary Toplist	
Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: <ul style="list-style-type: none"> <li>▪ <b>Top Talkers</b></li> <li>▪ <b>Top Connections</b></li> <li>▪ <b>Top Protocols</b></li> </ul>

### Primary Toplist

- [Any custom toplist you have added]

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

#### Scanning Interval

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

#### Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

#### Maintenance Window

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

#### Maintenance Begins At

This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail. For more information, please see [Toplists](#)<sup>1728</sup> section.

### 6.8.50 IPFIX (Custom) Sensor

The IPFIX (Custom) sensor receives traffic data from an IPFIX (Internet Protocol Flow Information Export) compatible device and shows the traffic by type. In this custom sensor, you can define your own channel definitions to divide traffic into different channels. Please make sure your device supports IPFIX when using this sensor.

**Note:** In order for this sensor to work, you have to enable IPFIX export on the device. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe). This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

For a general introduction to the technology behind flow monitoring, please see [Monitoring Bandwidth via Flows](#)<sup>[1966]</sup> section.

#### Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

Basic Sensor Settings	
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
IPFIX Specific Settings	
Receive IPFIX Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one configured in the IPFIX export options of your hardware router device. Please enter an integer value.
Sender IP	Enter the IP address of the sending device you want to receive the IPFIX data from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive IPFIX Packets on IP	Select the IP address(es) on which PRTG listens to IPFIX packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address selected here must match the one configured in the IPFIX export options of your hardware router device.
Active Flow Timeout (Minutes)	Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data is received, the sensor may switch to an <b>Unknown</b> status. Please enter an integer value. We recommend setting this one minute longer than the respective timeout configured in your hardware router device. <b>Note:</b> If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: <ul style="list-style-type: none"><li>▪ <b>Off:</b> The standard flow will be used.</li><li>▪ <b>On:</b> Switch into sampling mode and specify the sampling rate below.</li></ul>
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your device. If the number is different, monitoring results will be incorrect. Please enter an integer value.

### IPFIX Specific Settings

Channel Definition	<p>Please enter a channel definition to divide the traffic into different channels. Write each definition in one line. For detailed information, please see <a href="#">Channel Definitions for xFlow and Packet Sniffer Sensors</a><sup>[2036]</sup> section. All traffic for which no channel is defined will be accounted to the default channel named <b>Other</b>. <b>Note:</b> Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyze.</p>
Log Stream Data to Disk (for Debugging)	<p>Define if the probe will write a log file of the stream and packet data to the data folder (see <a href="#">Data Storage</a><sup>[2074]</sup>). Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>None (recommended):</b> Do not write additional log files. Recommended for normal use cases.</li> <li>▪ <b>Only for the 'Other' channel:</b> Only write log files of data that is not filtered otherwise and therefore accounted to the default <b>Other</b> channel.</li> <li>▪ <b>All stream data:</b> Write log files for all data received.</li> </ul> <p><b>Note:</b> Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.</p>

### Sensor Display

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>

Sensor Display	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.
Filtering	
Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>2032</sup> section.
Exclude Filter	First, the filters defined in the <b>Include Filter</b> field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>2032</sup> section.
Primary Toplist	
Primary Toplist	<p>Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:</p> <ul style="list-style-type: none"> <li>▪ <b>Top Talkers</b></li> <li>▪ <b>Top Connections</b></li> <li>▪ <b>Top Protocols</b></li> <li>▪ <b>[Any custom toplist you have added]</b></li> </ul>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

### Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail. For more information, please see [Toplists](#)<sup>[1728]</sup> section.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.51 IPMI System Health Sensor

The IPMI System Health sensor monitors the status of a system via the Intelligent Platform Management Interface (IPMI). It can show temperature, rotation per minute of fans, voltage, and the status of a power supply.

**Note:** You have to explicitly specify the credentials of the IPMI in the sensor settings.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>[2039]</sup>.

This sensor type has predefined limits for several metrics. These limits can be changed individually in the channel settings. For detailed information about channel limits please refer to the section [Sensor Channels Settings](#)<sup>[1709]</sup>.

**Important notice:** Currently, this sensor type is in **beta** status. The methods of operating can change at any time, as well as the available settings. **Do not expect** that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

#### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

Before you can actually add this sensor, PRTG will ask you to provide your credentials for the Intelligent Platform Management Interface (IPMI) in the [add sensor dialog](#)<sup>[220]</sup>. Enter the **Username** and the **Password** in the respective fields.

In order to monitor the system health via IPMI, PRTG will create one sensor for each metric you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

### IPMI Specific

Group	Select the measurements you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.
-------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### IPMI Credentials

Username	Enter the username for the Intelligent Platform Management Interface (IPMI). If not changed yet, this field shows the username that you defined during sensor creation.
Password	Enter the password for the Intelligent Platform Management Interface (IPMI). If not changed yet, this field shows the encrypted password that you defined the sensor creation.

IPMI Specific	
Group	Shows the measurement that this sensor monitors. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Logfile Result	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <b>Result of Sensor [ID].txt</b>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.52 jFlow V5 Sensor

The jFlow V5 sensor receives traffic data from a jFlow V5 compatible device and shows the traffic by type. On your hardware device, please make sure it matches jFlow V5 and disable any sampling option! There are several filter options available to divide traffic into different channels.

**Note:** In order for the sensor to work, jFlow export of the respective version must be enabled on the device. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe). The sensor does not support sampling, so please disable sampling in your jFlow device! This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

For a general introduction to the technology behind flow monitoring, please see [Monitoring Bandwidth via Flows](#)<sup>[196]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

jFlow V5 Specific Settings	
Receive jFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the jFlow export options of your hardware router device. Please enter an integer value. <b>Note:</b> When configuring export, please make sure you select the appropriate jFlow version for this sensor.
Sender IP	Enter the IP address of the sending device you want to receive the jFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive jFlow Packets on IP	Select the IP address(es) on which PRTG listens to jFlow packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address selected here must match the one configured in the jFlow export options of your hardware router device. <b>Note:</b> When configuring export, please make sure you select the appropriate jFlow version for this sensor.
Active Flow Timeout (Minutes)	Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data is received, the sensor may switch to an <b>Unknown</b> status. Please enter an integer value. We recommend setting this one minute longer than the respective timeout configured in your hardware router device. <b>Note:</b> If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Off:</b> The standard flow will be used.</li> <li>▪ <b>On:</b> Switch into sampling mode and specify the sampling rate below.</li> </ul>
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your exporter device. If the number is different, monitoring results will be incorrect. Please enter an integer value.
Log Stream Data to Disk (for Debugging)	Define if the probe will write a log file of the stream and packet data to the data folder (see <a href="#">Data Storage</a> <sup>2074</sup> ). Choose between: <ul style="list-style-type: none"> <li>▪ <b>None (recommended):</b> Do not write additional log files. Recommended for normal use cases.</li> <li>▪ <b>Only for the 'Other' channel:</b> Only write log files of data that is not filtered otherwise and therefore accounted to the default <b>Other</b> channel.</li> <li>▪ <b>All stream data:</b> Write log files for all data received.</li> </ul>

**jFlow V5 Specific Settings**

**Note:** Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

**Channel Configuration****Channel Selection**

Define the categories the traffic will be accounted to. There are different groups of traffic available. Choose between:

- **Web:** Internet web traffic.
- **File Transfer:** Traffic caused by FTP.
- **Mail:** Internet mail traffic.
- **Chat:** Traffic caused by chat and instant messaging.
- **Remote Control:** Traffic caused by remote control applications, such as RDP, SSH, Telnet, VNC.
- **Infrastructure:** Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, SNMP.
- **NetBIOS:** Traffic caused by NetBIOS communication.
- **Other Protocols:** Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, i.e. how detailed traffic will be divided. For each group, choose between:

- **No:** Do not account traffic of this group in an own channel. All traffic of this group will be accounted to the default channel named **Other**.
- **Yes:** Count all traffic of this group and summarize it into one channel.
- **Detail:** Count all traffic of this group and further divide it into different channels. The traffic will appear in several channels as shown in the **Content** column. **Note:** Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

**Note:** You can change the default configuration for groups and channels. For details, please see section **More**.

Filtering	
Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>[2032]</sup> section.
Exclude Filter	First, the filters defined in the <b>Include Filter</b> field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>[2032]</sup> section.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1700]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Primary Toplist	
Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: <ul style="list-style-type: none"> <li>▪ <b>Top Talkers</b></li> <li>▪ <b>Top Connections</b></li> <li>▪ <b>Top Protocols</b></li> </ul>

### Primary Toplist

- [Any custom toplist you have added]

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

#### Scanning Interval

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

#### Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

#### Maintenance Window

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

#### Maintenance Begins At

This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail. For more information, please see [Toplists](#)<sup>[1728]</sup> section.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.53 jFlow V5 (Custom) Sensor

The jFlow V5 (Custom) sensor receives traffic data from a jFlow V5 compatible device and shows the traffic by type. On your hardware device, please make sure it matches jFlow V5 and disable any sampling option! In this custom sensor, you can define your own channel definitions to divide traffic into different channels.

**Note:** In order for the sensor to work, jFlow export of the respective version must be enabled on the device. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe). The sensor does not support sampling, so please disable sampling in your jFlow device! This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

For a general introduction to the technology behind flow monitoring, please see [Monitoring Bandwidth via Flows](#)<sup>1966</sup> section.

#### Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

##### Basic Sensor Settings

Sensor Name

Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
jFlow Specific Settings	
Receive jFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one configured in the jFlow export options of your hardware router device. Please enter an integer value. <b>Note:</b> When configuring export, please make sure you select the appropriate jFlow version for this sensor.
Sender IP	Enter the IP address of the sending device you want to receive the jFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive jFlow Packets on IP	Select the IP address(es) on which PRTG listens to jFlow packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address selected here must match the one configured in the jFlow export options of your hardware router device. <b>Note:</b> When configuring export, please make sure you select the appropriate jFlow version for this sensor.
Active Flow Timeout (Minutes)	Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data is received, the sensor may switch to an <b>Unknown</b> status. Please enter an integer value. We recommend setting this one minute longer than the respective timeout configured in your hardware router device. <b>Note:</b> If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Off:</b> The standard flow will be used.</li> <li>▪ <b>On:</b> Switch into sampling mode and specify the sampling rate below.</li> </ul>

jFlow Specific Settings	
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your exporter device. If the number is different, monitoring results will be incorrect. Please enter an integer value.
Channel Definition	Please enter a channel definition to divide the traffic into different channels. Write each definition in one line. For detailed information, please see <a href="#">Channel Definitions for xFlow and Packet Sniffer Sensors</a> <sup>2036</sup> section. All traffic for which no channel is defined will be accounted to the default channel named <b>Other</b> . <b>Note:</b> Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyse.
Log Stream Data to Disk (for Debugging)	<p>Define if the probe will write a log file of the stream and packet data to the data folder (see <a href="#">Data Storage</a><sup>2074</sup>). Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>None (recommended):</b> Do not write additional log files. Recommended for normal use cases.</li> <li>▪ <b>Only for the 'Other' channel:</b> Only write log files of data that is not filtered otherwise and therefore accounted to the default <b>Other</b> channel.</li> <li>▪ <b>All stream data:</b> Write log files for all data received.</li> </ul> <p><b>Note:</b> Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.</p>
Filtering	
Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>2032</sup> section.
Exclude Filter	First, the filters defined in the <b>Include Filter</b> field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>2032</sup> section.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Primary Toplist	
Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: <ul style="list-style-type: none"> <li>▪ <b>Top Talkers</b></li> <li>▪ <b>Top Connections</b></li> <li>▪ <b>Top Protocols</b></li> <li>▪ <b>[Any custom toplist you have added]</b></li> </ul>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

### Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail. For more information, please see [Toplists](#)<sup>[1728]</sup> section.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.54 LDAP Sensor

The LDAP sensor monitors directory services using Lightweight Directory Access Protocol (LDAP), connecting to the server trying a "bind". It shows the response time. If the server does not respond or authentication fails, an error message will be triggered.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
LDAP Specific	
Port	Enter the LDAP port number, usually port 389 for unencrypted connections. Please enter an integer value.
Distinguished Name	Enter the <b>Distinguished Name</b> (DN) you want to authenticate to the LDAP server. Usually, this is the information for the user you want to authenticate with. For example, use the format <b>cn=Manager,dc=my-domain,dc=com</b> for a DN on an OpenLDAP server.

LDAP Specific	
Passwort	Enter the password for the entered Distinguished Name.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

**Notifications**

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

**Others**

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.55 Microsoft SQL Sensor

The Microsoft SQL sensor monitors a Microsoft Structured Query Language (SQL) server. It shows the response time, the number of records, and the value. The sensor can monitor if the database server accepts connections, processes requests, and returns an expected result when executing a custom SQL command.

The following SQL servers are supported: SQL Server 2008, SQL Server 2005 (including SQL Server Express / Server Compact Editions), SQL Server 2000, SQL Server 7 and MSDE (requires OLE DB installed on the machine running the PRTG probe that accesses the server)

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
SQL-Server Specific Data	
Timeout (sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered.

SQL-Server Specific Data	
Instance	Enter the SQL server instance's name if you want to connect to a "named instance". For example, such an instance's name could be <b>SQLEXPRESS</b> . <b>Note:</b> Sometimes you will see connection strings like <b>SQLSERVER\SQLINSTANCE</b> in database clients. The first part is the server name configured under the general server settings. The second part refers to the instance name mentioned above. Never enter this complete string in this PRTG form, merely provide the second part (without the backslash). Please enter a string or leave the field empty.
Port	Define the port for the SQL connection. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Automatic:</b> Automatically choose the right port.</li> <li>▪ <b>Manual:</b> Use a specific port. Define below. Standard value is <b>1433</b>.</li> </ul>
Port	This field is only visible if manual port selection is enabled above. Define the port number for the SQL connection. Please enter an integer value.

Database	
Database	Enter the name of the SQL database the sensor will connect to. For example, such a database's name could be <b>Northwind</b>
Authentication	Define the kind of authentication used for the connection to the database. Choose between: <ul style="list-style-type: none"> <li>▪ <b>SQL Server:</b> Use credentials specific to the SQL server. Please enter them below.</li> <li>▪ <b>Windows Authentication:</b> Use the Windows credentials defined for the parent device this sensor is created on. <b>Note:</b> For successful authentication, the defined Windows credentials must be known to the SQL server, and SQL server and the computer the PRTG probe is running on must be in the same domain.</li> </ul>
User	This field is only visible if SQL server authentication is enabled above. Enter the user name that will be used for the database connection.
Password	This field is only visible if SQL server authentication is enabled above. Enter the password that will be used for the database connection.

Data	
SQL Expression	<p>Enter a valid SQL statement to execute on the server. In your SELECT statement, please specify the field name explicitly. Do <b>not</b> use <b>SELECT *</b>! For example, a correct expression could be: <b>SELECT ProductName FROM Northwind.dbo.Products</b>. When a cursor is returned (i.e. with a SELECT statement), only the first row of data will be processed.</p> <p><b>Note:</b> Executing <b>stored procedures</b> is currently not supported.</p>
Record Count	<p>If you want to know how many records in your database were affected by your SQL expression as defined above, you can count the number of concerned records. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Do not count number of records:</b> Affected records will not be counted.</li> <li>▪ <b>Count number of records:</b> The number of affected records will be counted. <b>Note:</b> Enabling this option might increase the execution time of this sensor.</li> </ul>
Post-Processing	<p>If the SQL expression returns a result set, please define if you want to further process it. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore result set:</b> Do not do anything with the data returned.</li> <li>▪ <b>Process numerical result:</b> Regard the result set returned as integer or float. You can set the sensor to <b>Warning</b> or <b>Down</b> status for specific thresholds. Define below.</li> <li>▪ <b>Process string result:</b> Regard the result set returned as a string. You can set the sensor to error for certain sub-strings contained or missing. Define below.</li> <li>▪ <b>Monitor for changes:</b> Monitor if the result set has changed since last check. The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> whenever a sensor value changes.</li> </ul>
Condition "Warning"	<p>This field is only visible if numeric results is enabled above. Define a condition of the returned numeric SQL result set that will set the sensor to a <b>Warning</b> status. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>none:</b> Do not set the sensor to <b>Warning</b> status for any condition.</li> <li>▪ <b>equals:</b> Result set must be the same as the value provided below.</li> <li>▪ <b>is above:</b> Result set must be above the value provided below.</li> <li>▪ <b>lower than:</b> Result set must be below the value provided below.</li> </ul>

Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings  
55 Microsoft SQL Sensor

	<ul style="list-style-type: none"> <li>▪ <b>does not equal:</b> Result set must be unequal to the value provided below.</li> </ul> <p><b>Note:</b> This threshold check the SQL result set only. You can set additional thresholds in the sensor's <a href="#">channel settings</a> <small>1709</small>.</p>
Value	This field is only visible if numeric results is enabled above. Enter a value of the returned numeric SQL result set that will set the sensor into a <b>Warning</b> status. Please enter an integer or float value.
Condition "Down"	<p>This field is only visible if numeric results is enabled above. Define a condition of the returned numeric SQL result set that will set the sensor to a <b>Down</b> status. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>none:</b> Do not set the sensor to <b>Down</b> status for any condition.</li> <li>▪ <b>equals:</b> Result set must be the same as the value provided below.</li> <li>▪ <b>is above:</b> Result set must be above the value provided below.</li> <li>▪ <b>lower than:</b> Result set must be below the value provided below.</li> <li>▪ <b>does not equal:</b> Result set must be unequal to the value provided below.</li> </ul> <p><b>Note:</b> This threshold check the SQL result set only. You can set additional thresholds in the sensor's <a href="#">channel settings</a> <small>1709</small>.</p>
Value	This field is only visible if numeric results is enabled above. Enter a value of the returned numeric SQL result set that will set the sensor to a <b>Down</b> status. Please enter an integer value.
Response Must Include	This field is only visible if string results is enabled above. Enter a string that must be part of the returned SQL string. If it is not, the sensor will be set to an error state. Please enter a string or leave the field empty.
Response Must Not include	This field is only visible if string results is enabled above. Enter a string that must not be part of the returned SQL string. If it is, the sensor will be set to an error state. Please enter a string or leave the field empty.
<b>Sensor Display</b>	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.

Sensor Display	
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>

Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.56 MySQL Sensor

The MySQL sensor monitors a MySQL server. It connects to the server and shows the response time. Additionally, it can read the number of records and a value.

The following SQL servers are supported: MySQL server 5.1, 5.0, 4.1, 4.0, and 3.23

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
MySQL Server Specific Data	
Port	Define the port for the SQL connection. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Automatic:</b> Automatically choose the right port.</li> <li>▪ <b>Manual:</b> Use a specific port. Define below. Standard value is 3306.</li> </ul>

MySQL Server Specific Data	
Timeout (sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered.

DB/SQL Data	
Database	Enter the name of the SQL database the sensor will connect to. For example, such a database's name could be <b>MyDatabase</b> . This is a logical entity on the database server where database objects like tables or stored procedures exist. In case of the MySQL server it also reflects a physical directory structure where your database objects are stored. Enter the appropriate string which is the same as you would supply when invoking the <b>mysql.exe</b> admin tool (with the command line switch <b>-p</b> ) or after the login with <b>mysql.exe</b> with the command <b>use</b> .
User	Enter the user name that will be used for the database connection.
Password	Enter the password that will be used for the database connection.

Data	
SQL Expression	Enter a valid SQL statement to execute on the server. In your SELECT statement, please specify the field name explicitly. Do <b>not</b> use <b>SELECT *</b> ! For example, a correct expression could be: <b>SELECT AVG(UnitPrice) FROM Products</b> . When a cursor is returned (i.e. with a SELECT statement), only the first row of data will be processed.
Record Count	<p>If you want to know how many records in your database were affected by your SQL expression as defined above, you can count the number of concerned records. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Do not count number of records:</b> Affected records will not be counted.</li> <li>▪ <b>Count number of records:</b> The number of affected records will be counted. <b>Note:</b> Enabling this option might increase the execution time of this sensor.</li> </ul>
Post-Processing	<p>If the SQL expression returns a result set, please define if you want to further process it. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore result set:</b> Do not do anything with the data returned.</li> </ul>

	<ul style="list-style-type: none"> <li>▪ <b>Process numerical result:</b> Regard the result set returned as integer or float. You can set the sensor to <b>Warning</b> or <b>Down</b> status for specific thresholds. Define below.</li> <li>▪ <b>Process string result:</b> Regard the result set returned as a string. You can set the sensor to error for certain sub-strings contained or missing. Define below.</li> <li>▪ <b>Monitor for changes:</b> Monitor if the result set has changed since last check. The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <sup>1716</sup> whenever a sensor value changes.</li> </ul>
Condition "Warning"	<p>This field is only visible if numeric results is enabled above. Define a condition of the returned numeric SQL result set that will set the sensor to a <b>Warning</b> status. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>none:</b> Do not set the sensor to <b>Warning</b> status for any condition.</li> <li>▪ <b>equals:</b> Result set must be the same as the value provided below.</li> <li>▪ <b>is above:</b> Result set must be above the value provided below.</li> <li>▪ <b>lower than:</b> Result set must be below the value provided below.</li> <li>▪ <b>does not equal:</b> Result set must be unequal to the value provided below.</li> </ul> <p><b>Note:</b> This threshold check the SQL result set only. You can set additional thresholds in the sensor's <a href="#">channel settings</a> <sup>1709</sup>.</p>
Value	<p>This field is only visible if numeric results is enabled above. Enter a value of the returned numeric SQL result set that will set the sensor into a <b>Warning</b> status. Please enter an integer or float value.</p>
Condition "Down"	<p>This field is only visible if numeric results is enabled above. Define a condition of the returned numeric SQL result set that will set the sensor to a <b>Down</b> status. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>none:</b> Do not set the sensor to <b>Down</b> status for any condition.</li> <li>▪ <b>equals:</b> Result set must be the same as the value provided below.</li> <li>▪ <b>is above:</b> Result set must be above the value provided below.</li> <li>▪ <b>lower than:</b> Result set must be below the value provided below.</li> <li>▪ <b>does not equal:</b> Result set must be unequal to the value provided below.</li> </ul> <p><b>Note:</b> This threshold check the SQL result set only. You can set additional thresholds in the sensor's <a href="#">channel settings</a> <sup>1709</sup>.</p>

## Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

## 56 MySQL Sensor

Value	This field is only visible if numeric results is enabled above. Enter a value of the returned numeric SQL result set that will set the sensor to a <b>Down</b> status. Please enter an integer value.
Response Must Include	This field is only visible if string results is enabled above. Enter a string that must be part of the returned SQL string. If it is not, the sensor will be set to an error state. Please enter a string or leave the field empty.
Response Must Not include	This field is only visible if string results is enabled above. Enter a string that must not be part of the returned SQL string. If it is, the sensor will be set to an error state. Please enter a string or leave the field empty.

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Note:** For this sensor type, no port number can be set.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.57 NetFlow V5 Sensor

The NetFlow V5 sensor receives traffic data from a NetFlow V5 compatible device and shows the traffic by type. Please make sure the sensor matches the NetFlow version your device is exporting! There are several filter options available to divide traffic into different channels.

**Note:** In order for the sensor to work, NetFlow export of the respective version must be enabled on the device. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe). This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

For a general introduction to the technology behind flow monitoring, please see [Monitoring Bandwidth via Flows](#)<sup>[196]</sup> section.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

NetFlow Specific Settings	
Receive NetFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the NetFlow export options of your hardware router device. Please enter an integer value. <b>Note:</b> When configuring export, please make sure you select the appropriate NetFlow version for this sensor.
Sender IP	Enter the IP address of the sending device you want to receive the NetFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive NetFlow Packets on IP	Select the IP address(es) on which PRTG listens to NetFlow packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address selected here must match the one configured in the NetFlow export options of your hardware router device. <b>Note:</b> When configuring export, please make sure you select the appropriate NetFlow version for this sensor.
Active Flow Timeout (Minutes)	Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data is received, the sensor may switch to an <b>Unknown</b> status. Please enter an integer value. We recommend setting this one minute longer than the respective timeout configured in your hardware router device. <b>Note:</b> If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Off:</b> The standard flow will be used.</li> <li>▪ <b>On:</b> Switch into sampling mode and specify the sampling rate below.</li> </ul>
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your exporter device. If the number is different, monitoring results will be incorrect. Please enter an integer value.
Log Stream Data to Disk (for Debugging)	Define if the probe will write a log file of the stream and packet data to the data folder (see <a href="#">Data Storage</a> <sup>2074</sup> ). Choose between: <ul style="list-style-type: none"> <li>▪ <b>None (recommended):</b> Do not write additional log files. Recommended for normal use cases.</li> <li>▪ <b>Only for the 'Other' channel:</b> Only write log files of data that is not filtered otherwise and therefore accounted to the default <b>Other</b> channel.</li> <li>▪ <b>All stream data:</b> Write log files for all data received.</li> </ul>

**NetFlow Specific Settings**

**Note:** Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

**Channel Configuration****Channel Selection**

Define the categories the traffic will be accounted to. There are different groups of traffic available. Choose between:

- **Web:** Internet web traffic.
- **File Transfer:** Traffic caused by FTP.
- **Mail:** Internet mail traffic.
- **Chat:** Traffic caused by chat and instant messaging.
- **Remote Control:** Traffic caused by remote control applications, such as RDP, SSH, Telnet, VNC.
- **Infrastructure:** Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, SNMP.
- **NetBIOS:** Traffic caused by NetBIOS communication.
- **Other Protocols:** Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, i.e. how detailed traffic will be divided. For each group, choose between:

- **No:** Do not account traffic of this group in an own channel. All traffic of this group will be accounted to the default channel named **Other**.
- **Yes:** Count all traffic of this group and summarize it into one channel.
- **Detail:** Count all traffic of this group and further divide it into different channels. The traffic will appear in several channels as shown in the **Content** column. **Note:** Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

**Note:** You can change the default configuration for groups and channels. For details, please see section **More**.

Filtering	
Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>[2032]</sup> section.
Exclude Filter	First, the filters defined in the <b>Include Filter</b> field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>[2032]</sup> section.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1700]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.
Primary Toplist	
Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: <ul style="list-style-type: none"> <li>▪ <b>Top Talkers</b></li> <li>▪ <b>Top Connections</b></li> <li>▪ <b>Top Protocols</b></li> </ul>

**Primary Toplist**

- [Any custom toplist you have added]

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

**Maintenance Begins At**

This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail. For more information, please see [Toplists](#)<sup>1728</sup> section.

## 6.8.58 NetFlow V5 (Custom) Sensor

The NetFlow V5 (Custom) sensor receives traffic data from a NetFlow V5 compatible device and shows the traffic by type. Please make sure the sensor matches the NetFlow version your device is exporting! In this custom sensor, you can define your own channel definitions to divide traffic into different channels.

**Note:** In order for the sensor to work, NetFlow export of the respective version must be enabled on the device. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe). This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

For a general introduction to the technology behind flow monitoring, please see [Monitoring Bandwidth via Flows](#)<sup>[1966]</sup> section.

### Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[226]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

**Basic Sensor Settings**

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**NetFlow Specific Settings**

Receive NetFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one configured in the NetFlow export options of your hardware router device. Please enter an integer value. <b>Note:</b> When configuring export, please make sure you select the appropriate NetFlow version for this sensor.
Sender IP	Enter the IP address of the sending device you want to receive the NetFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive NetFlow Packets on IP	Select the IP address(es) on which PRTG listens to NetFlow packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address selected here must match the one configured in the NetFlow export options of your hardware router device. <b>Note:</b> When configuring export, please make sure you select the appropriate NetFlow version for this sensor.
Active Flow Timeout (Minutes)	Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data is received, the sensor may switch to an <b>Unknown</b> status. Please enter an integer value. We recommend setting this one minute longer than the respective timeout configured in your hardware router device. <b>Note:</b> If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Off:</b> The standard flow will be used.</li> <li>▪ <b>On:</b> Switch into sampling mode and specify the sampling rate below.</li> </ul>
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your device. If the number is different, monitoring results will be incorrect. Please enter an integer value.

NetFlow Specific Settings	
Channel Definition	<p>Please enter a channel definition to divide the traffic into different channels. Write each definition in one line. For detailed information, please see <a href="#">Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors</a><sup>2036</sup> section. All traffic for which no channel is defined will be accounted to the default channel named <b>Other</b>.</p> <p><b>Note:</b> Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyze.</p>
Log Stream Data to Disk (for Debugging)	<p>Define if the probe will write a log file of the stream and packet data to the data folder (see <a href="#">Data Storage</a><sup>2074</sup>). Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>None (recommended):</b> Do not write additional log files. Recommended for normal use cases.</li> <li>▪ <b>Only for the 'Other' channel:</b> Only write log files of data that is not filtered otherwise and therefore accounted to the default <b>Other</b> channel.</li> <li>▪ <b>All stream data:</b> Write log files for all data received.</li> </ul> <p><b>Note:</b> Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.</p>
Filtering	
Include Filter	<p>Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a><sup>2032</sup> section.</p>
Exclude Filter	<p>First, the filters defined in the <b>Include Filter</b> field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a><sup>2032</sup> section.</p>
Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Primary Toplist	
Primary Toplist	<p>Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:</p> <ul style="list-style-type: none"> <li>▪ <b>Top Talkers</b></li> <li>▪ <b>Top Connections</b></li> <li>▪ <b>Top Protocols</b></li> <li>▪ <b>[Any custom toplist you have added]</b></li> </ul>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail. For more information, please see [Toplists](#)<sup>[1728]</sup> section.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.59 NetFlow V9 Sensor

The NetFlow V9 sensor receives traffic data from a NetFlow V9 compatible device and shows the traffic by type. Please make sure the sensor matches the NetFlow version your device is exporting! There are several filter options available to divide traffic into different channels.

**Note:** In order for the sensor to work, NetFlow export of the respective version must be enabled on the device. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe). This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

For a general introduction to the technology behind flow monitoring, please see [Monitoring Bandwidth via Flows](#)<sup>[196]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

NetFlow Specific Settings	
Receive NetFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the NetFlow export options of your hardware router device. Please enter an integer value. <b>Note:</b> When configuring export, please make sure you select the appropriate NetFlow version for this sensor.
Sender IP	Enter the IP address of the sending device you want to receive the NetFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive NetFlow Packets on IP	Select the IP address(es) on which PRTG listens to NetFlow packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address selected here must match the one configured in the NetFlow export options of your hardware router device. <b>Note:</b> When configuring export, please make sure you select the appropriate NetFlow version for this sensor.
Active Flow Timeout (Minutes)	Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data is received, the sensor may switch to an <b>Unknown</b> status. Please enter an integer value. We recommend setting this one minute longer than the respective timeout configured in your hardware router device. <b>Note:</b> If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Off:</b> The standard flow will be used.</li> <li>▪ <b>On:</b> Switch into sampling mode and specify the sampling rate below.</li> </ul>
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your exporter device. If the number is different, monitoring results will be incorrect. Please enter an integer value.
Log Stream Data to Disk (for Debugging)	Define if the probe will write a log file of the stream and packet data to the data folder (see <a href="#">Data Storage</a> <sup>2074</sup> ). Choose between: <ul style="list-style-type: none"> <li>▪ <b>None (recommended):</b> Do not write additional log files. Recommended for normal use cases.</li> <li>▪ <b>Only for the 'Other' channel:</b> Only write log files of data that is not filtered otherwise and therefore accounted to the default <b>Other</b> channel.</li> <li>▪ <b>All stream data:</b> Write log files for all data received.</li> </ul>

**NetFlow Specific Settings**

**Note:** Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

**Channel Configuration****Channel Selection**

Define the categories the traffic will be accounted to. There are different groups of traffic available. Choose between:

- **Web:** Internet web traffic.
- **File Transfer:** Traffic caused by FTP.
- **Mail:** Internet mail traffic.
- **Chat:** Traffic caused by chat and instant messaging.
- **Remote Control:** Traffic caused by remote control applications, such as RDP, SSH, Telnet, VNC.
- **Infrastructure:** Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, SNMP.
- **NetBIOS:** Traffic caused by NetBIOS communication.
- **Other Protocols:** Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, i.e. how detailed traffic will be divided. For each group, choose between:

- **No:** Do not account traffic of this group in an own channel. All traffic of this group will be accounted to the default channel named **Other**.
- **Yes:** Count all traffic of this group and summarize it into one channel.
- **Detail:** Count all traffic of this group and further divide it into different channels. The traffic will appear in several channels as shown in the **Content** column. **Note:** Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

**Note:** You can change the default configuration for groups and channels. For details, please see section **More**.

Filtering	
Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>2032</sup> section.
Exclude Filter	First, the filters defined in the <b>Include Filter</b> field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>2032</sup> section.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1700</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.
Primary Toplist	
Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: <ul style="list-style-type: none"> <li>▪ <b>Top Talkers</b></li> <li>▪ <b>Top Connections</b></li> <li>▪ <b>Top Protocols</b></li> </ul>

**Primary Toplist**

- [Any custom toplist you have added]

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

**Maintenance Begins At**

This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail. For more information, please see [Toplists](#)<sup>1728</sup> section.

## 6.8.60 NetFlow V9 (Custom) Sensor

The NetFlow V9 (Custom) sensor receives traffic data from a NetFlow V9 compatible device and shows the traffic by type. Please make sure the sensor matches the NetFlow version your device is exporting! In this custom sensor, you can define your own channel definitions to divide traffic into different channels.

**Note:** In order for the sensor to work, NetFlow export of the respective version must be enabled on the device. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe). This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

For a general introduction to the technology behind flow monitoring, please see [Monitoring Bandwidth via Flows](#)<sup>[1966]</sup> section.

### Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[226]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

**Basic Sensor Settings**

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**NetFlow Specific Settings**

Receive NetFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one configured in the NetFlow export options of your hardware router device. Please enter an integer value. <b>Note:</b> When configuring export, please make sure you select the appropriate NetFlow version for this sensor.
Sender IP	Enter the IP address of the sending device you want to receive the NetFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive NetFlow Packets on IP	Select the IP address(es) on which PRTG listens to NetFlow packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address selected here must match the one configured in the NetFlow export options of your hardware router device. <b>Note:</b> When configuring export, please make sure you select the appropriate NetFlow version for this sensor.
Active Flow Timeout (Minutes)	Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data is received, the sensor may switch to an <b>Unknown</b> status. Please enter an integer value. We recommend setting this one minute longer than the respective timeout configured in your hardware router device. <b>Note:</b> If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Off:</b> The standard flow will be used.</li> <li>▪ <b>On:</b> Switch into sampling mode and specify the sampling rate below.</li> </ul>
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your device. If the number is different, monitoring results will be incorrect. Please enter an integer value.

NetFlow Specific Settings	
Channel Definition	<p>Please enter a channel definition to divide the traffic into different channels. Write each definition in one line. For detailed information, please see <a href="#">Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors</a><sup>2036</sup> section. All traffic for which no channel is defined will be accounted to the default channel named <b>Other</b>.</p> <p><b>Note:</b> Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyze.</p>
Log Stream Data to Disk (for Debugging)	<p>Define if the probe will write a log file of the stream and packet data to the data folder (see <a href="#">Data Storage</a><sup>2074</sup>). Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>None (recommended):</b> Do not write additional log files. Recommended for normal use cases.</li> <li>▪ <b>Only for the 'Other' channel:</b> Only write log files of data that is not filtered otherwise and therefore accounted to the default <b>Other</b> channel.</li> <li>▪ <b>All stream data:</b> Write log files for all data received.</li> </ul> <p><b>Note:</b> Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.</p>
Filtering	
Include Filter	<p>Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a><sup>2032</sup> section.</p>
Exclude Filter	<p>First, the filters defined in the <b>Include Filter</b> field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a><sup>2032</sup> section.</p>
Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Primary Toplist	
Primary Toplist	<p>Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:</p> <ul style="list-style-type: none"> <li>▪ <b>Top Talkers</b></li> <li>▪ <b>Top Connections</b></li> <li>▪ <b>Top Protocols</b></li> <li>▪ <b>[Any custom toplist you have added]</b></li> </ul>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#) settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#).

## Channel Unit Configuration

### Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

**Note:** Custom channel types can be set on sensor level only.

## Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail. For more information, please see [Toplists](#)<sup>[1728]</sup> section.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.61 Oracle SQL Sensor

The Oracle SQL sensor monitors an Oracle SQL server. It connects to the server and shows the response time (measured from the time when the connection is opened to the time when the return values of the SQL query—if configured—have been received). Additionally, it can read the number of records and a value.

The following SQL servers are supported: Supports Oracle servers 11g, 10g, 9i, 8i, 8.0, and 7.3, including Oracle 10g Express, and Oracle 8i Personal and Lite editions (requires default TCP port setting 1521).

**Note:** On the client computer running the PRTG probe where this sensor is created on, **Oracle Net** is used for direct TCP/IP communication; OCI is not supported any more. You do not need to install an Oracle client or define a **TNSNAMES.ORA** on the client computer.

**Note:** With **Oracle version 11.2.0.4**, Oracle's TCP/IP authentication method has changed. You will encounter connection problems with credential errors when using the direct connection mode as of this Oracle version. In this case, please install the 32-bit Oracle client on the machine which is running the PRTG probe and choose **Use Oracle client** as connection mode in the sensor settings.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

**Basic Sensor Settings**

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Oracle Specific Data**

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered.
Port	Enter the port number that will be used for the connection. Default value is <b>1521</b> . Please enter an integer value.
Connection Mode	<p>Select which mode you want to use to connect to the Oracle server. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use direct mode (TCP/IP):</b> Use <b>Oracle Net</b> for direct TCP/IP communication. <b>Note:</b> As of Oracle version 11.2.0.4, please use the Oracle client (see sensor description above).</li> <li>▪ <b>Use Oracle client:</b> Use the Oracle client for communication. It needs to be installed the machine which is running the PRTG probe.</li> </ul>

**DB/SQL Data**

Service Name / Alias	Enter the name of the SQL database the sensor will connect to. For example, such a database's name could be <b>orcl</b>
User	Enter the user name that will be used for the database connection.
Password	Enter the password that will be used for the database connection.

**Data**

SQL Expression	Enter a valid SQL statement to execute on the server. In your SELECT statement, please specify the field name explicitly. Do <b>not</b> use <b>SELECT *</b> ! For example, a correct expression could be: <b>SELECT sum(salary) FROM hr.employees</b> . When a cursor is returned (i.e. with a SELECT statement), only the first row of data will be processed.
----------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Record Count	<p>If you want to know how many records in your database were affected by your SQL expression as defined above, you can count the number of concerned records. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Do not count number of records:</b> Affected records will not be counted.</li> <li>▪ <b>Count number of records:</b> The number of affected records will be counted. <b>Note:</b> Enabling this option might increase the execution time of this sensor.</li> </ul>
Post-Processing	<p>If the SQL expression returns a result set, please define if you want to further process it. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore result set:</b> Do not do anything with the data returned.</li> <li>▪ <b>Process numerical result:</b> Regard the result set returned as integer or float. You can set the sensor to <b>Warning</b> or <b>Down</b> status for specific thresholds. Define below.</li> <li>▪ <b>Process string result:</b> Regard the result set returned as a string. You can set the sensor to error for certain sub-strings contained or missing. Define below.</li> <li>▪ <b>Monitor for changes:</b> Monitor if the result set has changed since last check. The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <small>1716</small> whenever a sensor value changes.</li> </ul>
Condition "Warning"	<p>This field is only visible if numeric results is enabled above. Define a condition of the returned numeric SQL result set that will set the sensor to a <b>Warning</b> status. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>none:</b> Do not set the sensor to <b>Warning</b> status for any condition.</li> <li>▪ <b>equals:</b> Result set must be the same as the value provided below.</li> <li>▪ <b>is above:</b> Result set must be above the value provided below.</li> <li>▪ <b>lower than:</b> Result set must be below the value provided below.</li> <li>▪ <b>does not equal:</b> Result set must be unequal to the value provided below.</li> </ul> <p><b>Note:</b> This threshold check the SQL result set only. You can set additional thresholds in the sensor's <a href="#">channel settings</a> <small>1709</small>.</p>
Value	<p>This field is only visible if numeric results is enabled above. Enter a value of the returned numeric SQL result set that will set the sensor into a <b>Warning</b> status. Please enter an integer or float value.</p>

Condition "Down"	<p>This field is only visible if numeric results is enabled above. Define a condition of the returned numeric SQL result set that will set the sensor to a <b>Down</b> status. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>none</b>: Do not set the sensor to <b>Down</b> status for any condition.</li> <li>▪ <b>equals</b>: Result set must be the same as the value provided below.</li> <li>▪ <b>is above</b>: Result set must be above the value provided below.</li> <li>▪ <b>lower than</b>: Result set must be below the value provided below.</li> <li>▪ <b>does not equal</b>: Result set must be unequal to the value provided below.</li> </ul> <p><b>Note:</b> This threshold check the SQL result set only. You can set additional thresholds in the sensor's <a href="#">channel settings</a> <sup>1709</sup>.</p>
Value	<p>This field is only visible if numeric results is enabled above. Enter a value of the returned numeric SQL result set that will set the sensor to a <b>Down</b> status. Please enter an integer value.</p>
Response Must Include	<p>This field is only visible if string results is enabled above. Enter a string that must be part of the returned SQL string. If it is not, the sensor will be set to an error state. Please enter a string or leave the field empty.</p>
Response Must Not include	<p>This field is only visible if string results is enabled above. Enter a string that must not be part of the returned SQL string. If it is, the sensor will be set to an error state. Please enter a string or leave the field empty.</p>

### Sensor Display

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default)</b>: Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other</b>: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>

### Sensor Display

#### Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

#### Scanning Interval

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

#### Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

#### Maintenance Window

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>941</sup>.</p>

## More

Knowledge Base: How do PRTG sensors connect to Oracle databases?

- <http://kb.paessler.com/en/topic/52803>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.62 Packet Sniffer Sensor

Monitors the headers of data packets passing a local network card using built-in packet sniffer. You can choose from predefined channels. Only header traffic will be analyzed.

**Note:** This sensor can be set up on a Probe Device only! By default, you can only monitor traffic passing the PRTG probe system on which's **Probe Device** the sensor is set up (either a local or remote probe). To monitor other traffic in your network, you can configure a monitoring port (if available) to which the switch sends a copy of all traffic. You can then physically connect this port to a network card of the computer the PRTG probe (either local or remote probe) is running on. This way, PRTG will be able to analyze the complete traffic that passes through the switch. This feature of your hardware may be called Switched Port Analyzer (SPAN), port mirroring, or port monitoring.

For a general introduction to the technology behind packet sniffing, please see [Monitoring Bandwidth via Packet Sniffing](#)<sup>[1964]</sup> section.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

Basic Sensor Settings	
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Sniffer Specific	
Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>2032</sup> section.
Exclude Filter	First, the filters defined in the <b>Include Filter</b> field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>2032</sup> section.
Network Adapters	Define the network adapters that will be monitored by the sensor. You see a list of names with all adapters available on the probe system. To select an adapter, set a check mark symbol in front of the respective name.
Log Stream Data to Disk (for Debugging)	<p>Define if the probe will write a log file of the stream and packet data to the data folder (see <a href="#">Data Storage</a><sup>2074</sup>). Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>None (recommended):</b> Do not write additional log files. Recommended for normal use cases.</li> <li>▪ <b>Only for the 'Other' channel:</b> Only write log files of data that is not filtered otherwise and therefore accounted to the default <b>Other</b> channel.</li> <li>▪ <b>All stream data:</b> Write log files for all data received.</li> </ul> <p><b>Note:</b> Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.</p>
Channel Configuration	
Channel Selection	<p>Define the categories the traffic will be accounted to. There are different groups of traffic available. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Web:</b> Internet web traffic.</li> <li>▪ <b>File Transfer:</b> Traffic caused by FTP.</li> </ul>

Channel Configuration	
	<ul style="list-style-type: none"> <li>▪ <b>Mail:</b> Internet mail traffic.</li> <li>▪ <b>Chat:</b> Traffic caused by chat and instant messaging.</li> <li>▪ <b>Remote Control:</b> Traffic caused by remote control applications, such as RDP, SSH, Telnet, VNC.</li> <li>▪ <b>Infrastructure:</b> Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, SNMP.</li> <li>▪ <b>NetBIOS:</b> Traffic caused by NetBIOS communication.</li> <li>▪ <b>Other Protocols:</b> Traffic caused by various other protocols via UDP and TCP.</li> </ul> <p>For each traffic group, you can select how many channels will be used for each group, i.e. how detailed traffic will be divided. For each group, choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No:</b> Do not account traffic of this group in an own channel. All traffic of this group will be accounted to the default channel named <b>Other</b>.</li> <li>▪ <b>Yes:</b> Count all traffic of this group and summarize it into one channel.</li> <li>▪ <b>Detail:</b> Count all traffic of this group and further divide it into different channels. The traffic will appear in several channels as shown in the <b>Content</b> column. <b>Note:</b> Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.</li> </ul> <p><b>Note:</b> You can change the default configuration for groups and channels. For details, please see section <b>More</b>.</p>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

Primary Toplist	
Primary Toplist	<p>Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:</p> <ul style="list-style-type: none"> <li>▪ <b>Top Talkers</b></li> <li>▪ <b>Top Connections</b></li> <li>▪ <b>Top Protocols</b></li> <li>▪ <b>[Any custom toplist you have added]</b></li> </ul>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail. For more information, please see [Toplists](#)<sup>[1728]</sup> section.

### 6.8.63 Packet Sniffer (Custom) Sensor

Monitors the headers of data packets passing a local network card using built-in packet sniffer. You can define your own channels. There are no predefined channels for this sensor type. Only header traffic will be analyzed.

**Note:** This sensor can be set up on a Probe Device only! By default, you can only monitor traffic passing the PRTG probe system on which's **Probe Device** the sensor is set up (either a local or remote probe). To monitor other traffic in your network, you can configure a monitoring port (if available) to which the switch sends a copy of all traffic. You can then physically connect this port to a network card of the computer the PRTG probe (either local or remote probe) is running on. This way, PRTG will be able to analyze the complete traffic that passes through the switch. This feature of your hardware may be called Switched Port Analyzer (SPAN), port mirroring, or port monitoring.

For a general introduction to the technology behind packet sniffing, please see [Monitoring Bandwidth via Packet Sniffing](#)<sup>1964</sup> section.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

#### Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

##### Basic Sensor Settings

Sensor Name

Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Sniffer specific	
Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see <a href="#">Filter Rules for xFlow and Packet Sniffer Sensors</a> <sup>[2032]</sup> section.
Exclude Filter	First, the filters defined in the <b>Include Filter</b> field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see <a href="#">Filter Rules for xFlow and Packet Sniffer Sensors</a> <sup>[2032]</sup> section.
Channel Definition	Please enter a channel definition to divide the traffic into different channels. Write each definition in one line. For detailed information, please see <a href="#">Channel Definitions for xFlow and Packet Sniffer Sensors</a> <sup>[2036]</sup> section. All traffic for which no channel is defined will be accounted to the default channel named <b>Other</b> . <b>Note:</b> Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyse. We recommend to not use more than 20 channels in graphs and tables, and not more than 100 channels in total. For performance reasons, it is better to add several sensors with less channels each.
Network Adapters	Define the network adapters that will be monitored by the sensor. You see a list of names with all adapters available on the probe system. To select an adapter, set a check mark symbol in front of the respective name.
Log Stream Data to Disk (for Debugging)	Define if the probe will write a log file of the stream and packet data to the data folder (see <a href="#">Data Storage</a> <sup>[2074]</sup> ). Choose between: <ul style="list-style-type: none"> <li>▪ <b>None (recommended):</b> Do not write additional log files. Recommended for normal use cases.</li> </ul>

Sniffer specific	
	<ul style="list-style-type: none"> <li>▪ <b>Only for the 'Other' channel:</b> Only write log files of data that is not filtered otherwise and therefore accounted to the default <b>Other</b> channel.</li> <li>▪ <b>All stream data:</b> Write log files for all data received.</li> </ul> <p><b>Note:</b> Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.</p>
Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>
Primary Toplist	
Primary Toplist	<p>Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:</p> <ul style="list-style-type: none"> <li>▪ <b>Top Talkers</b></li> <li>▪ <b>Top Connections</b></li> <li>▪ <b>Top Protocols</b></li> <li>▪ <b>[Any custom toplist you have added]</b></li> </ul>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail. For more information, please see [Toplists](#)<sup>[1728]</sup> section.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.64 Passive Application Performance Sensor

The Passive Application Performance sensor monitors Transport Control Protocol (TCP) connection timings using packet sniffer. It can measure the performance of many different web applications without actually having direct access to neither the client nor the server. In order to obtain valuable data, these applications must work TCP-based and initiate a new session with each request.

The sensor shows the total number of packets per second on the selected network card, the number of dropped packets per second by PRTG because of system overload (more processor power is required if this value is above zero to cope with the traffic), as well as the number of currently active connections on all monitored applications.

For defined applications, the sensor can show (together with the corresponding application name):

- Request time in msec: average time between the initial (SYN) packet from the client and the first request package from the client
- Response time in msec: average time between the initial (SYN) packet from the client and first packet of the result from the server
- ACK (acknowledge) time in msec: average time between the initial (SYN) packet of a connection from the client until the server sends an ACK (acknowledge) packet. This means that a TCP connection was successfully established (in LANs this value is zero in most cases and only increases for extreme loads).
- Count: total number of observed connections to the service in the last monitoring interval. This is the number of measurements the average is based on. The higher the value the more reliable/averaged the data is. If this value is zero, PRTG did not see any packets for this service.

**Important notice:** This sensor is an experimental sensor. Currently, it is in **beta** status. The methods of operating can change at any time, as well as the available settings. **Do not expect** that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

For a general introduction to the technology behind packet sniffing, please see [Monitoring Bandwidth via Packet Sniffing](#)<sup>[1964]</sup> section.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Applications	
Network Adapter	Select the network adapter you want to monitor.
Applications	Define the applications you want to monitor. For each application, use one dedicated line. Use the following syntax to define an application to be monitored: <b>ip:port=application</b> . Provide the IP address and port number of the application. Behind the equals sign, enter a name for the application which will be displayed in the channels. Please enter a string. This sensor will create four sensor channels with the application name, e.g., "Application (ACK)".
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.

Sensor Display	
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>

Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>159</sup> to choose an object on which the current sensor will be dependent on.</p>

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.65 PerfCounter Custom Sensor

The PerfCounter Custom sensor monitors a configured set of Windows Performance Counters. You can define your own channels. There are no predefined channels available for this sensor type. To find out which performance counters are available on the target system and what their names are, please see section [More](#)<sup>[766]</sup>.

### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible.

**Note:** The user account has to be a member of the **Performance Monitor Users** user group on the target system.

### Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the **RemoteRegistry** "Remote Registry" Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible.

To enable the service, please log in to the respective computer and open the services manager (e.g. via **services.msc**). In the list, find the respective service and set its **Start Type** to **Automatic**.

### Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>[209]</sup>. **Note:** The target system may well run on Windows 2003 or later.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Performance Counter Settings	
List of Counters	Enter a list of performance counters which will be queried. Define one counter per row. PRTG will create one channel for each counter. Use the following syntax: the name of the counter, followed by two colons (::) and the unit. Example: <code>\Processor(_Total)\% Processor Time::%</code>
Mode	<p>This setting determines if the returning value will be displayed as absolute value or if the difference between the last and the current value will be used. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Absolute (recommended):</b> The returning value will be displayed as absolute value.</li> <li>▪ <b>Difference:</b> The difference between last and current value will be displayed. <b>Note:</b> Please make sure that all counters which are monitored are capable of this mode if you select it.</li> </ul>

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Performance Counter Settings	
List of Counters	The list of counters monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Mode	The mode in which the returning values are displayed. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.66 PerfCounter IIS Application Pool Sensor

The PerfCounter IIS Application Pool sensor monitors a Microsoft Internet Information Services (IIS) application pool using Windows Performance Counters. This sensor can show the overall state of an application pool, the number of worker processes, the number of failures in worker processes, as well as the number of ping failures, shutdown failures, and startup failures in worker processes.

### Requirement: Microsoft IIS Version 7.5

In order to monitor Microsoft Internet Information Services (IIS) application pools, this sensor needs IIS version 7.5 or later to be installed on the target system.

### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible.

**Note:** The user account has to be a member of the **Performance Monitor Users** user group on the target system.

### Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the **RemoteRegistry** "Remote Registry" Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible.

To enable the service, please log in to the respective computer and open the services manager (e.g. via **services.msc**). In the list, find the respective service and set its **Start Type** to **Automatic**.

### Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>[2090]</sup>. **Note:** The target system may well run on Windows 2003 or later.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor Microsoft Internet Information Services (IIS) application pools, PRTG will create one sensor for each pool. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

### IIS Application Pool Specific

Application Pool	A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.
------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### IIS Application Pool Specific

Application Pool	The name of the application pool that is monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

### Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#) settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#).

## Channel Unit Configuration

### Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

**Note:** Custom channel types can be set on sensor level only.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.67 Ping Sensor

The Ping sensor sends an Internet Control Message Protocol (ICMP) echo request ("Ping") from the computer running the probe to the device it is created on, in order to monitor the availability of a device. When using more than one Ping per interval, it also measures minimum and maximum Ping time as well as packet loss in percent.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[226]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Ping Settings	
Timeout (Sec.)	Enter a timeout in seconds for the Ping. If the reply takes longer than this value the request is aborted and an error message is triggered.
Packet Size (Bytes)	Enter the packet size in bytes for the Ping. You can choose any value between <b>1</b> and <b>10000</b> . We recommend using the default value.

Ping Settings	
Ping Method	<p>Define the kind of Ping check that will be performed. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Send one single Ping:</b> With each scanning interval, send a single Ping only. A sensor in this setting will show the Ping time only. This setting is good for simply availability monitoring.</li> <li>▪ <b>Send multiple Ping request:</b> With each scanning interval, send multiple Pings in a row. A sensor in this setting will also show minimum and maximum Ping time as well as packet loss (in percent). This setting is good if you want to create reports about average Ping times out of a series of ping requests. <b>Note:</b> When using multiple request, all of them have to get lost in order for the sensor to switch to a <b>Down</b> status. For example, if there is only one Ping request answered in a series of five, the sensor will still show a green <b>Up</b> status.</li> </ul>
Ping Count	<p>This field is only visible if sending multiple Pings is enabled above. Enter the number of Pings that are sent in a row for one interval. Please enter an integer value.</p>
Ping Delay (in ms)	<p>This field is only visible if sending multiple Pings is enabled above. Enter the time in milliseconds PRTG has to wait between two Ping requests. Please enter an integer value. <b>Note:</b> Increase the value if the target device drops Ping packets due to denial-of-service (DOS) suspicion.</p>
Auto Acknowledge	<p>You can define that a <b>Down</b> status of this sensor will be <a href="#">acknowledged</a><sup>[145]</sup> automatically.</p> <ul style="list-style-type: none"> <li>▪ <b>Show "Down" status on error (default):</b> Do not automatically acknowledge an alarm if this sensor changes to a <b>Down</b> status.</li> <li>▪ <b>Show "Down (Acknowledged)" status on error:</b> Automatically acknowledge an alarm. If this sensor changes to a <b>Down</b> status, it will automatically change to <b>Down (Acknowledged)</b>. <b>Note:</b> The sensor will also go through a <b>Down</b> status, so any <a href="#">sensor state triggers</a><sup>[1716]</sup> using this will still provoke notifications, as configured.</li> </ul>
Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>

Sensor Display	
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>

Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>159</sup> to choose an object on which the current sensor will be dependent on.</p>

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.68 Ping Jitter Sensor

The Ping Jitter sensor sends a series of Internet Control Message Protocol (ICMP) echo requests ("Pings") to the given URI to determine the statistical jitter. The Real Time Jitter value is updated every time a packet is received using the formula described in RFC 1889:

$$\text{Jitter} = \text{Jitter} + ( \text{abs}( \text{ElapsedTime} - \text{OldElapsedTime} ) - \text{Jitter} ) / 16$$

The Statistical Jitter value is calculated on the first x packets received using the statistical variance formula:

$$\text{Jitter Statistical} = \text{SquareRootOf}( \text{SumOf}( ( \text{ElapsedTime}[i] - \text{Average} ) ^ 2 ) / ( \text{ReceivedPacketCount} - 1 ) )$$

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 2.0.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be
-------------	------------------------------------------------------------------

Basic Sensor Settings	
	shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
Ping Count	Define the number of pings that will be sent. Please enter an integer value.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[170]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

**Schedules, Dependencies, and Maintenance Window****Dependency Type**

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device it is created on is in a **Down** status, or if it is paused by another dependency.
- **Select object:** Pause the current sensor if the device it is created on is in an **Down** status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

**Note:** Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.

**Dependency**

This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the [object selector](#)<sup>[159]</sup> to choose an object on which the current sensor will be dependent on.

**Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>94</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.69 Pingdom Sensor

The Pingdom sensor queries an account at Pingdom.com and retrieves values for one "check" configured in the respective Pingdom account. With every scanning interval, the sensor will always catch the last value available in the "detailed check log" of your Pingdom account.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 2.0.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

**Basic Sensor Settings**

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Settings**

Pingdom Check Name	Enter the name of the "check" you want to retrieve data for. Enter it exactly the way configured in your Pingdom account. This setting is case sensitive! Please enter a string.
Username	Please enter the username of the Pingdom account you want to query. Please enter a string.
Password	Please enter the password of the Pingdom account you want to query. Please enter a string.
If Value Changes	<p>Define what shall be done in case the value of this sensor changes. You can choose between:</p> <ul style="list-style-type: none"> <li>• <b>Ignore changes (default):</b> No action will be taken on change.</li> <li>• <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <sup>1716</sup> whenever the sensor value changes.</li> </ul>

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1831</sup>. <b>Note:</b> Please make sure you select the same scanning interval you configured for the "check" in your Pingdom account. Only if the intervals match PRTG can catch every measurement from your "check".</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.70 POP3 Sensor

The POP3 sensor monitors a mail server using Post Office Protocol version 3 (POP3). It shows the response time of the server.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Pop3 Specific	
Timeout	Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered.
Port	Specify the port that will be used for the POP3 connection. For non-secure connections usually port 110 is used; usually port 995 for SSL connections. The actual setting depends on the server you are connecting to. Please enter an integer value. We recommend using the default value. If you do not get a connection, please try another port number.
Security	<p>Specify if an encryption will be used for the connection. Choose between:</p> <ul style="list-style-type: none"><li>▪ <b>Encrypt data using Transport-Level Security (TLS)</b></li><li>▪ <b>No encryption (use plain text)</b></li></ul>
SSL-Method	<p>This field is only visible if security is enabled above. Select the SSL method that will be used when connecting to the server. We recommend using the default value. Only if you experience connection problems, try another setting. Choose between:</p> <ul style="list-style-type: none"><li>▪ <b>SSL V2</b></li><li>▪ <b>SSL V2 or V3</b></li><li>▪ <b>SSL V3</b></li><li>▪ <b>TLS V1</b></li></ul>

Pop3 Authorisation	
POP3 Authentication Type	<p>Select the kind of authentication for the POP3 connection. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Without Login:</b> Monitor the connection to the POP3 server only.</li> <li>• <b>Username and Password:</b> Log into the POP3 server with user name and password (simple login, non-secure).</li> <li>• <b>128-bit MD5 hash value (APOP):</b> Send the password in an encrypted form using APOP. This option must be supported by the POP3 server you're connecting to.</li> </ul>
Username	This field is only visible if an option with login is selected above. Enter a username for POP3 authentication. Please enter a string.
Password	This field is only visible if an option with login is selected above. Enter a password for POP3 authentication. Please enter a string.

Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <small>1709</small> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

**Schedules, Dependencies, and Maintenance Window**

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>94</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.71 POP3 Email Count Sensor

The POP3 Email Count sensor connects to a POP3 email account and returns the number of emails stored in it. Additionally, you can filter by **to** or **from** address, or by **subject**, to only count mails matching the search pattern.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

#### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 2.0.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

**Basic Sensor Settings**

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Settings**

Username	Define the username of the POP3 account you want to log into. <b>Note:</b> As POP3 server, this sensor will use the parent device's <b>IP Address/DNS Name</b> value.
Password	Define the password for the POP3 account. <b>Note:</b> As POP3 server, this sensor will use the parent device's <b>IP Address/DNS Name</b> value.
Mailserver POP3 Port	Define the port number the POP3 server is running at. Please enter an integer value. <b>Note:</b> As POP3 server, this sensor will use the parent device's <b>IP Address/DNS Name</b> value.
Use SSL	Define whether to use SSL for the connection to the POP3 server. Choose between: <ul style="list-style-type: none"> <li>▪ <b>No</b></li> <li>▪ <b>Yes</b></li> </ul> <b>Note:</b> As POP3 server, this sensor will use the parent device's hostname.
Filter To Address	Optionally define a <b>To</b> address. Only mails containing this will be counted by the sensor. Please enter a string or leave the field empty.
Filter From Address	Optionally define a <b>From</b> address. Only mails containing this will be counted by the sensor. Please enter a string or leave the field empty.
Filter Subject Content	Optionally define an email <b>Subject</b> . Only mails containing this will be counted by the sensor. Please enter a string or leave the field empty.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.72 Port Sensor

The Port sensor monitors a network service by connecting to its port. It tries to connect to the specified TCP/IP port number of a device and waits for the request to be accepted. Depending on your settings, it can alert you either when the monitored port is open, or when it is closed.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Port Specific	
Timeout (sec.)	Enter a timeout in seconds for the port connect. If the reply takes longer than this value the request is aborted and an error message is triggered.
Port	Enter the number of the port the sensor will try to connect to. Please enter an integer value.

Port Specific	
SSL (Secure Sockets Layer)	<p>Specify if an encryption will be used for the connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Don't use SSL (recommended)</b></li> <li>▪ <b>Use SSL</b></li> </ul>
SSL-Method	<p>This field is only visible if security is enabled above. Select the SSL method that will be used when connecting to the server. We recommend using the default value. Only if you experience connection problems, try another setting. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>SSL V2</b></li> <li>▪ <b>SSL V2 or V3</b></li> <li>▪ <b>SSL V3</b></li> <li>▪ <b>TLS V1</b></li> </ul>
Advanced Sensor Settings	
Goal	<p>Define how the sensor will report on the port defined above. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Open:</b> The sensor will return a green <b>OK</b> status if the port is open, and show a red <b>Down</b> status if the port is closed.</li> <li>▪ <b>Closed:</b> The sensor will return a green <b>OK</b> status if the port is closed, and show a red <b>Down</b> status if the port is open.</li> </ul>
Command	<p>Define whether a command will be sent after the port is opened. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Don't send command:</b> Only check if a connection to the port is possible.</li> <li>▪ <b>Send command:</b> Open a Telnet session to the respective port and send the command. <b>Note:</b> You cannot use this option if the target machine is a webserver.</li> </ul>
Command	<p>This field is only visible if sending a command is enabled above. Enter a command that will be sent in Telnet session to the respective port. You cannot use line breaks, but a simple Telnet command in a single line only. Please enter a string.</p>
Response	<p>Define if the response received will be further processed. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore response:</b> Do not check the response.</li> </ul>

Advanced Sensor Settings	
	<ul style="list-style-type: none"> <li>▪ <b>Check response code (integer):</b> Check if the response matches a defined response code. Define below.</li> <li>▪ <b>Check response text:</b> Check if the response matches a defined response text. Define below.</li> </ul>
Allowed Code	This field is only visible if response code check is enabled above. Enter a code that must be returned. If it does not match the sensor will be set to a <b>Down</b> status. Please enter an integer value.
Check For Existing Keywords (Positive)	<p>This setting is only visible if text processing is activated above. Check if a certain keyword is part of the received value. If there is no match, the sensor will show a "Down" status.</p> <ul style="list-style-type: none"> <li>▪ <b>Disable:</b> Do not check for positive keywords.</li> <li>▪ <b>Enable keyword check (positive):</b> Check if a certain keyword exists in the received value. Define below.</li> </ul>
Text Must Include	This setting is only visible if keyword check is activated above. Enter a search string that must be contained in the returned value.
For Keyword Search Use	<p>Define the method you want to provide the search string with. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Plain Text:</b> Search for a simple string.</li> <li>▪ <b>Regular Expression:</b> Search using a regular expression. For more details, see <a href="#">Regular Expressions</a><sup>2048</sup> section.</li> </ul>
Check For Existing Keywords (Negative)	<p>This setting is only visible if text processing is activated above. Check if a certain keyword is <b>not</b> part of the received value. If there <b>is</b> a match, the sensor will show a "Down" status.</p> <ul style="list-style-type: none"> <li>▪ <b>Disable:</b> Do not check for negative keywords.</li> <li>▪ <b>Enable keyword check (negative):</b> Check if a certain keyword does not exist in the received value. Define below.</li> </ul>
Text Must Not Include	This setting is only visible if keyword check is activated above. Enter a search string that must not be contained in the returned value.
For Keyword Search Use	<p>Define the method you want to provide the search string with. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Plain Text:</b> Search for a simple string.</li> <li>▪ <b>Regular Expression:</b> Search using a regular expression. For more details, see <a href="#">Regular Expressions</a><sup>2048</sup> section.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>  . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.73 Port Range Sensor

The Port Range sensor monitors a network service by connecting to various TCP/IP ports. It tries to connect to the specified TCP/IP port numbers of a device in succession and waits for each request to be accepted. It returns the number of closed ports and open ports in two different channels. Optionally, you can set limits in the sensor's channel settings. This way you can get alerted about open/closed ports.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Port Range Specific	
Timeout (sec.)	Enter a timeout in seconds for the port connect. If the reply takes longer than this value the request is aborted and an error message is triggered.
Port-by-Port-Delay (ms)	Specify in milliseconds how long the sensor will wait to go to the next port while running through all given ports.

Port Range Specific	
Port Range Selection Method	<p>Define whether you want to monitor all ports within a range or if you want to monitor several individual ports. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Port Range with start/end:</b> Monitor ports within a range.</li> <li>▪ <b>List of Ports:</b> Provide a list of several individual ports to monitor.</li> </ul>
Range Start	<p>This field is only visible if the port range method is enabled above. Enter the port number where the scan will start. Please enter an integer value.</p>
Range End	<p>This field is only visible if the port range method is enabled above. Enter the port number where the scan will end. Please enter an integer value.</p>
Port List	<p>This field is only visible if the list of ports method is enabled above. Enter the numbers of the ports the sensor will try to connect to. Please enter one or more individual integer values.</p>
If Value Changes	<p>Define what will be done in case the value of a sensor channel changes. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore changes:</b> No action will be taken on change.</li> <li>▪ <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <sup>1716</sup> whenever the sensor value changes.</li> </ul>
Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>94</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.74 Probe Health Sensor

The Probe Health sensor monitors internal PRTG parameters. It shows the state of the PRTG probe (either for the local probe, a [remote probe](#)<sup>[2050]</sup>, or a [cluster](#)<sup>[87]</sup> probe). This sensor type is created automatically by PRTG and cannot be deleted. It checks various parameters of your PRTG system which can affect the quality of the monitoring results:

- **Health:** This index value sums up the probe state into a value between 100% (healthy) and 0% (failing). Frequent or repeated health values below 100% should be investigated.
- **CPU Load:** This channel shows the current percentage CPU load. Extensive CPU load can lead to false, incomplete, and incorrect monitoring results. This value usually should stay below 50%.
- **Handles:** This is a counter for the data structures of the operating system. It is responsible for internal resource management. Repeated obviously increasing values should be investigated.
- **Interval Delay non-WMI&SNMP:** This channel shows the percentage interval delay for all sensor types which are not from the type SNMP or WMI.
- **Interval Delay SNMP:** This channel shows the percentage interval delay for SNMP sensors. If this value is above 0% there are probably very slow SNMP V3 sensors. In this case, try to increase the monitoring intervals or distribute the sensors over several probes.
- **Interval Delay WMI:** This channel shows the percentage interval delay for WMI sensors. If this value is above 0% WMI sensors could not be checked according to their interval. 100% means that WMI sensors on the average are checked with twice their interval. For values above 0% try to increase the monitoring intervals or distribute the sensors over several probes to keep the number of WMI sensors per probe below 120 (with 60 seconds interval) or 600 (with 300 seconds interval).
- **Lost Flow Packets:** This channel shows the percentage of lost flow packets.
- **Memory Usage:** This channel shows the amount of memory being used by the PRTG probe service as reported by the memory manager. Repeated obviously increasing values should be investigated. If the value is constantly above 2 GB this indicates that PRTG runs at its limits. In this case you should distribute some sensors to [Remote Probe](#)<sup>[2050]</sup>.
- **Message Queue:** This channel shows the number of monitoring results from the probe which have not been processed yet by the core. This value usually should stay below 1/10 of the sensor count.
- **Open Requests:** This channel shows the number of currently active monitoring requests. This value should stay below the maximum of 500 open requests.
- **Threads:** This channel shows the number of program parts which are running simultaneously currently. This value can increase with heavy load. The number should not exceed 100 in normal operation.

This sensor can be set up on a Probe Device only!

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[170]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

#### Scanning Interval

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>94</sup>.

### Channel Unit Configuration

#### Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

**Note:** Custom channel types can be set on sensor level only.

### Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

### Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

### Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.75 QoS (Quality of Service) One Way Sensor

The QoS (Quality of Service) One Way sensor monitors parameters regarding the quality of a network connection between two probes, which is important, for example, when using Voice over IP (VoIP) over this connection. The sensor sends a series of UDP packets from the parent probe to another probe and measures packet loss, jitter, Packet Delay Variation (PDV), etc.

**Note:** In order for this sensor to work, there has to be at least one [remote probe](#)<sup>[2049]</sup> configured in your setup. The sensor can be created on the **Probe Device** of either a local or remote probe.

**Note:** This sensor type cannot be cloned using the [Clone Object](#)<sup>[1734]</sup> function.

For a general introduction to the technology behind Quality of Service monitoring, please see [Monitoring Quality of Service](#)<sup>[1971]</sup> section.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Quality of Service Measurement	
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered. The maximum timeout is 900 seconds (15 minutes).
Target Probe	Define the target probe that will receive the UDP packets. In the drop down menu, all local and remote probes of your setup are shown. When running the sensor on the local probe, select a remote probe as <b>Target Probe</b> ; if no remote probe is available, please <a href="#">install and connect a remote probe</a> first. When running the sensor on a remote probe, select either another remote probe or the local probe as target. The sensor will measure values for the network track between the probe the sensor is created on and the target probe. <b>Note:</b> You must ensure that firewalls, NAT rules, etc. will allow the UDP packets to reach the target probe. The Windows firewall on the target system will be automatically opened by the probe.
Target Host/IP	Define the IP address of the target probe to which the probe the sensor is created on will connect. When you're not using NAT rules, this is usually the address shown above next to the target probe's name.
Port	Define the <b>source</b> and <b>target</b> port for the UDP packets. This port will be used on both the source and target probe. Please use a different port for each QoS sensor to make sure packets can be assigned correctly. Enter an integer value between <b>1024</b> and <b>65536</b> . <b>Note:</b> This port must be available on both the source and target system.
Number of Packets	Define how many packets are sent for each scanning interval. We recommend using <b>1000</b> . Please enter an integer value.
Size of Packets (Bytes)	Define the size in bytes of the packets sent. We recommend using <b>172</b> . Please enter an integer value.
Time between Packets (ms)	Define the size in milliseconds that will be waited between two packets. We recommend using <b>20</b> . Please enter an integer value.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.

Sensor Display	
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>

Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

### Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.76 QoS (Quality of Service) Round Trip Sensor

The QoS (Quality of Service) Round Trip sensor monitors parameters regarding the quality of a network connection between two probes. This is important, for example, when using Voice over IP (VoIP) over this connection. The sensor sends a series of UDP packets from the parent probe to another probe. Then, the traffic is sent back to the original probe. The sensor measures packet loss, jitter, Packet Delay Variation (PDV), the round trip time (RTT), etc.

**Note:** In order for this sensor to work, there has to be at least one [remote probe](#)<sup>[2049]</sup> configured in your setup. The sensor can be created on the **Probe Device** of either a local or remote probe.

**Note:** This sensor type cannot be cloned using the [Clone Object](#)<sup>[1734]</sup> function.

For a general introduction to the technology behind Quality of Service monitoring, please see [Monitoring Quality of Service](#)<sup>[1971]</sup> section.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Quality of Service Measurement	
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered. The maximum timeout is 900 seconds (15 minutes).
Target Probe	Define the target probe that will receive the UDP packets. In the drop down menu, all local and remote probes of your setup are shown. When running the sensor on the local probe, select a remote probe as <b>Target Probe</b> ; if no remote probe is available, please <a href="#">install and connect a remote probe</a> first. When running the sensor on a remote probe, select either another remote probe or the local probe as target. The sensor will measure values for the network track between the probe the sensor is created on and the target probe. <b>Note:</b> You must ensure that firewalls, NAT rules, etc. will allow the UDP packets to reach the target probe. The Windows firewall on the target system will be automatically opened by the probe.
Target Host/IP	Define the IP address of the target probe to which the probe the sensor is created on will connect. When you're not using NAT rules, this is usually the address shown above next to the target probe's name.
Port	Define the <b>source</b> and <b>target</b> port for the UDP packets. This port will be used on both the source and target probe. Please use a different port for each QoS sensor to make sure packets can be assigned correctly. Enter an integer value between <b>1024</b> and <b>65536</b> . <b>Note:</b> This port must be available on both the source and target system.
Number of Packets	Define how many packets are sent for each scanning interval. We recommend using <b>1000</b> . Please enter an integer value.
Size of Packets (Bytes)	Define the size in bytes of the packets sent. We recommend using <b>172</b> . Please enter an integer value.
Time between Packets (ms)	Define the size in milliseconds that will be waited between two packets. We recommend using <b>20</b> . Please enter an integer value.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.

Sensor Display	
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>

Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

### Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.77 RADIUS Sensor

The RADIUS sensor monitors a Remote Authentication Dial-In User Service (RADIUS) server. The sensor tries to authenticate at the server and shows the response time. If authentication fails, it will show an error.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Radius specific	
Timeout (sec)	Enter a timeout in seconds for the request. If the reply takes longer than this value, the request is aborted and an error message is triggered.
User	Define the user name used for authentication at the server. Please enter a string.
Password	Define the password used for authentication between the client and the RADIUS server. Please enter a string. <b>Note:</b> The password <b>must not</b> be longer than 6 characters.
Secret	Define the shared secret used for authentication between the authenticator (here the PRTG Probe) and the server. Please enter a string.
Port	Enter the port number used for connection to the server. Default value is <b>1812</b> . Please enter an integer value.
NAS IP Address	Define a valid NAS IP address or leave the field empty.
NAS-Identifier	Enter a NAS identifier. Please enter a string or leave the field empty.
Use Chap	Add a check mark if you want to use the <b>Challenge Handshake Authentication Protocol</b> .

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <small>1709</small> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

**Notifications**

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

**Others**

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.78 RDP (Remote Desktop) Sensor

The RDP (Remote Desktop) Sensor monitors remote desktop services (RDP, Terminal Services Client).

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Specific	
Timeout (sec)	Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered.
Port	Enter the number of the port the sensor will try to connect to. Please enter an integer value. Default value is <b>3389</b> . We recommend using the default value.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.79 SCVMM Host Sensor

The SCVMM Host sensor monitors a host that is managed by a Microsoft System Center Virtual Machine Manager (SCVMM). This can be, for example, a Hyper-V host, a VMware host, or a XenServer host. It can show the CPU usage, free memory (in bytes and percentage), the overall status, the communication status, the status of the cluster node, the status of the virtual server, the computer status, and the VM count.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>2050</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>276</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

**Note:** Your Windows credentials may not contain any double quotation marks ("). If they do, this sensor will not work!

### Requirement: Remote PowerShell 2.0

This sensor type uses PowerShell commands. In order to monitor devices with this sensor, **Remote PowerShell 2.0** has to be enabled. For detailed information, please see [More](#)<sup>847</sup> section below. **Note:** PowerShell 1.0 is not supported.

### Requirement: VMM PowerShell Plugin

This sensor type needs the VMM PowerShell Plugin to be installed on the target machine. Under Windows 2008 and 2012 it is part of the VMM 2008 Administrator Console, or the VMM 2012 Management Console, respectively.

**Note:** To provide good performance, the System Center Virtual Manager (SCVMM) only reads the performance data from time to time and caches them. Because of this, updates can take up to several minutes. If your monitoring returns the same values again and again, please increase the scanning interval.

## Requirement for Windows Server 2012 Compatibility

In order to make this sensor type compatible for Windows Server 2012 systems, the following requirements have to be met:

- The SCVMM PowerShell module has to be in the directory `C:\Program Files\Microsoft System Center 2012\Virtual Machine Manager\bin\psModules\virtualmachinemanager\virtualmachinemanager`.
- You have to set the execution policy in PowerShell to allow the execution of `Import-Module C:\Program Files\Microsoft System Center 2012\Virtual Machine Manager\bin\psModules\virtualmachinemanager\virtualmachinemanager`. Use the command `Set-ExecutionPolicy`. We recommend the execution policy `RemoteSigned`; `AllSigned` and `Unrestricted` are also possible.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor hosts, PRTG will create one sensor for each host. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Host Settings	
Host	Select the hosts you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head. <b>Note:</b> Please make sure the name of your hosts do not contain unsupported characters, especially avoid the hash ('#') sign. We recommend to not rename hosts once you've set up monitoring. For detailed information, please see <a href="#">More</a> <sup>[602]</sup> section below.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Host Settings	
Sensor Result	<p>Define what will be done with the results the sensor receives. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>[2074]</sup> section.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.80 SCVMM Virtual Machine Sensor

The SCVMM Virtual Machine sensor monitors a virtual machine (VM) that is managed by a Microsoft System Center Virtual Machine Manager (SCVMM). This can be, for example, a Hyper-V virtual machine, a VMware virtual machine, or a XenServer virtual machine. It can show the CPU usage, the status of a VM, and disk read and write speed.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

#### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

#### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

**Note:** Your Windows credentials may not contain any double quotation marks ("). If they do, this sensor will not work!

#### Requirement: Remote PowerShell 2.0

This sensor type uses PowerShell commands. In order to monitor devices with this sensor, **Remote PowerShell 2.0** has to be enabled. For detailed information, please see [More](#)<sup>[854]</sup> section below. **Note:** PowerShell 1.0 is not supported.

#### Requirement: VMM PowerShell Plugin

This sensor type needs the VMM PowerShell Plugin to be installed on the target machine. Under Windows 2008 and 2012 it is part of the VMM 2008 Administrator Console, or the VMM 2012 Management Console, respectively.

**Note:** To provide good performance, the System Center Virtual Manager (SCVMM) only reads the performance data from time to time and caches them. Because of this, updates can take up to several minutes. If your monitoring returns the same values again and again, please increase the scanning interval.

## Requirement for Windows Server 2012 Compatibility

In order to make this sensor type compatible for Windows Server 2012 systems, the following requirements have to be met:

- The SCVMM PowerShell module has to be in the directory `C:\Program Files\Microsoft System Center 2012\Virtual Machine Manager\bin\psModules\virtualmachinemanager\virtualmachinemanager`.
- You have to set the execution policy in PowerShell to allow the execution of `Import-Module C:\Program Files\Microsoft System Center 2012\Virtual Machine Manager\bin\psModules\virtualmachinemanager\virtualmachinemanager`. Use the command `Set-ExecutionPolicy`. We recommend the execution policy `RemoteSigned`; `AllSigned` and `Unrestricted` are also possible.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor VMs, PRTG will create one sensor for each VM. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

### Virtual Machine Settings

Virtual Machine	Select the Virtual Machines (VMs) you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head. <b>Note:</b> Please make sure the name of your VMs do not contain unsupported characters, especially avoid the hash ('#') sign. We recommend to not rename VMs once you've set up monitoring. For detailed information, please see <a href="#">More</a> <sup>[602]</sup> section below.
-----------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### Virtual Machine Settings

Sensor Result	<p>Define what will be done with the results the sensor receives. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>[2074]</sup> section.</li> </ul>
---------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.81 Sensor Factory Sensor

The Sensor Factory sensor is a powerful tool that allows you to create your own sensor with channels based on data from other sensors. You can define one or more channels using formulas that combine monitoring results from other sensors.

Samples for usage are:

- Show single channels of one or more sensors in one graph.
- Use the data from single channels of one or more sensors to calculate new values (for example, you can subtract, multiply, and divide).
- Create graphs with data from other sensor channels and add horizontal lines at specific vertical positions.

**Note:** A sensor factory sensor does not show a "Downtime" channel. Downtime cannot be calculated for this sensor type.

**Note:** The Sensor Factory sensor might not work with [flow sensors](#)<sup>[196]</sup>. Sensor types using **active flow timeout**, this is, [NetFlow and jFlow sensors](#)<sup>[291]</sup>, are not supported by the Sensor Factory sensor.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

#### Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Factory Specific Settings	
Channel Definition	Enter a channel definition for the sensor. Using a specific syntax, you can refer to data from channels of other sensors here. You can also calculate values. Enter one channel definition for each new channel you want to add to this sensor. Please see section <a href="#">Define Sensor Channels</a> <sup>[861]</sup> below.
Error Handling	<p>Define the sensor's behavior if one of the sensors defined above is in an error status. In this case, you can set the sensor factory sensor either to error or to warning status. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Factory sensor shows error status when one or more source sensors are in error status:</b> If at least one sensor used in a channel definition is in a <b>Down</b> status, the factory sensor will show a <b>Down</b> status as well until all referred sensors leave this status. While the factory sensor is <b>Down</b> it will still show data of all available sensor channels.</li> <li>• <b>Factory sensor shows warning status when one or more source sensors are in error status:</b> If at least one sensor used in a channel definition is in a <b>Down</b> status, the factory sensor will show a <b>Warning</b> status until all referred sensors leave the <b>Down</b> status.</li> <li>• <b>Use custom formula:</b> Define the status of the factory sensor by adding a status definition in the field below.</li> </ul>
Status Definition	This field is only visible if custom formula is enabled above. Define when the sensor will switch to a <b>Down</b> status. You can use the status() function in combination with Boolean operations. For advanced users it is also possible to calculate a status value. Please see section <a href="#">Define Sensor Status</a> <sup>[868]</sup> below.
If a Sensor Has No Data	<p>Choose how this Sensor Factory sensor will react in case a sensor referred to in the channel definition does not provide any data (for example, because it is paused or does not exist). Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Do not calculate factory channels that use the sensor:</b> For channels that are defined using one or more sensor(s) that deliver no data, no data will be shown. Additionally, the sensor will show a <b>Warning</b> state.</li> <li>▪ <b>Calculate the factory channels and use zero as source value:</b> If a sensor used in a channel definition does not deliver any data, zero values will be filled in instead. The channel will be calculated and shown using these values.</li> </ul>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

**Schedules, Dependencies, and Maintenance Window****Dependency Type**

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device it is created on is in a **Down** status, or if it is paused by another dependency.
- **Select object:** Pause the current sensor if the device it is created on is in an **Down** status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

**Note:** Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.

**Dependency**

This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the [object selector](#)<sup>[159]</sup> to choose an object on which the current sensor will be dependent on.

**Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

## Define Sensor Channels

The channels of a Sensor Factory sensor are controlled by the **Channel Definition** text field. Using a special syntax you can refer to other sensor channels, calculate values, and add horizontal lines. You can define factory sensor channels using data from any other sensor's channels on your PRTG core server.

**Example**

You see a definition of two factory sensor channels, both using the `channel()` function which simply collects data from the channels of other sensors in your monitoring and displays them:

```
#1:Local Probe Health
channel(1001,0)
#2:Local Traffic Out[kbit]
channel(1004,1)
```

The first channel of the factory sensor (**#1**) collects data from the **Health** channel (**ID 0**) of the **Core/Probe Health** sensor (**ID 1001**) running on the Local Probe device. The second channel (**#2**) collects data from the **Traffic out** channel (**ID 1**) of a traffic sensor (**ID 1004**) measuring the system's local network card. Both channels will be shown together in the factory sensor's data tables and graphs.

The basic syntax for a sensor factory channel definition looks like this:

```
#<id>:<name>[<unit>]
<formula>
```

For each channel one section is used. A section begins with the # sign. Function names in formulas are not case sensitive.

The parameters are:

- **<id>** is the ID of the factory sensor's channel and must be a unique number > 0.
- **<name>** is the name of the factory sensor's channel (displayed in graphs and tables).
- **[<unit>]** is an optional unit description for the factory sensor's channel (e.g. bytes). If it is not provided a fitting unit string is selected automatically (recommended).
- **<formula>** contains the formula to calculate the factory sensor's channel. For the formula, you can use the following functions: [channel\(\)](#)<sup>863</sup>, [min\(\)](#)<sup>864</sup>, [max\(\)](#)<sup>864</sup>, [avg\(\)](#)<sup>864</sup>, or [percent\(\)](#)<sup>865</sup>.

## Define Sensor Channels—Formula Calculations

Within a formula the following elements are allowed to perform calculations with the values that are returned by one or more functions:

- Basic operations: + (add), - (subtract), \* (multiply), / (divide)  
Example: `3 + 5 * 2`
- Brackets: ()  
Example: `3 * (2 + 6)`

- Compare: = (equal), <> (not equal), > (greater), < (less), >= (greater or equal), <= (less or equal)  
If the compare is true the value is **10,000**; if false the value is **0**. For delta sensors the speed is compared.

### Example

You see a Sensor Factory channel definition with calculation.

```
#1:Traffic Total x Minus Traffic Out y
( channel(2001,-1) - channel(1004,1) ) * 2
```

This full channel definition will result in a factory sensor showing a calculation with values from two channels (channel IDs **-1** and **1**) of two traffic sensors (sensor IDs **2001** and **1004**). The returned values will be subtracted and then multiplied by two.

Channels can be gauge values (e.g. Ping ms) or delta values (e.g. traffic kbit/s). Not all combinations are allowed in a formula. **Note:** When performing percentage calculation, please use the [percent\(\) Function](#) <sup>863</sup> to make sure you obtain the expected values!

There are calculations you **cannot** do:

- You cannot add/subtract a delta from a gauge channel (and vice versa).
- You cannot multiply two delta channels.
- You cannot compare a delta with a gauge channel.
- You cannot use a channel of (another) Sensor Factory sensor channel in the formula.

### Define Sensor Channels—channel() Function

The **channel()** function allows to read the data from a channel of a different sensor. The syntax is:

```
channel(<sensorId>,<channelId>)
```

The parameters are:

- **<sensorId>** is the ID of the sensor. It is displayed on the sensor details page, in the **Overview** tab behind the sensor name.
- **<channelId>** is the ID of the sensor channel. It is displayed on the sensor details page, in the **Channels** tab for each channel behind the channel name.

### Example

```
channel(2001,2)
```

This function reads the data from channel ID **2** of the sensor with the ID **2001**.

```
#1:Sample  
channel(2001,2)
```

This full channel definition reads the data from channel ID **2** of the sensor with the ID **2001** and displays it in the first factory sensor channel (**#1**), without any additional calculations.

## Define Sensor Channels—min() and max() Functions

The **min()** and **max()** functions return the minimum or maximum of the two values. The syntax is:

```
min(<a>,<b>)  
max(<a>,<b>)
```

Values for **<a>** and **<b>** are either numbers or [channel\(\)](#)<sup>863</sup> functions.

### Examples

```
min(10,5)
```

This function in the first line returns **5**, as this is the smaller value out of 10 and 5.

```
min( channel(2001,1),channel(2002,1) )
```

This function returns the minimum of channel **1** of the sensor with ID **2001** and channel **1** of the sensor with ID **2002**.

## Define Sensor Channels—avg() Function

The **avg()** function returns the average of the two values. This equals:  $(a+b) / 2$ . The syntax is:

```
avg(<a>,<b>)
```

Values for **<a>** and **<b>** are either numbers or [channel\(\)](#)<sup>863</sup> functions.

**Examples**

```
avg(20,10)
```

This function returns **15**:  $(20+10) / 2 = 15$ .

```
avg(channel(2001,1),channel(2002,1))
```

This function returns the average of channel **1** of the sensor with ID **2001** and channel **1** of the sensor with ID **2002**.

**Define Sensor Channels—percent() Function**

The **percent()** function calculates the percent value of two given values, for example, a channel and a fixed value. The syntax is:

```
percent(<source>,<maximum>[,<unit>])
```

The parameters are:

- **<source>** is the value the percent is calculated for. This is usually a [channel\(\)](#)<sup>863</sup> function.
- **<maximum>** is the limit value used for the percent calculation.
- **[<unit>]** is an optional unit the maximum is provided in. You can use constants with this function (see [Constants](#)<sup>867</sup> section below for a list). This can be used for gauge (e.g. Ping sensors) or delta (e.g. traffic sensors). If no unit is provided **1** will be used. Note: As unit string **%** will be added automatically.

PRTG will calculate:  $\text{<source>} / \text{<maximum>} * \text{<unit>} * 100$

### Examples

```
#1:Usage Traffic In
percent(channel(2001,0),100,kilobit)
#2:Usage Traffic Out
percent(channel(2001,1),100,kilobit)
```

This full channel definition will result in a factory sensor showing two channels of a traffic sensor (sensor ID **2001**): Traffic in (channel ID **0**) and traffic out (channel ID **1**). The values will be displayed as % of maximum bandwidth (100 kilobit/second).

```
#1:Ping %
percent(channel(2002,0),200)
```

This full channel definition will result in a factory sensor showing the **Ping Time** channel (channel ID **0**) of a Ping sensor (sensor ID **2002**). The values will be displayed as a percentage of 200 ms.

### Define Sensor Channels—Horizontal Lines

You can add lines to the graph using a formula without **channel()** function. Use a fixed value instead. The syntax is:

```
#<id>:<name>[<unit>]
<value>
```

The parameters are:

- **<id>** is the ID of the factory sensor's channel and must be a unique number > 1. Although a horizontal line will not be shown as a channel, the ID has to be unique.
- **<name>** is the name of the factory sensor's channel. When used here it will not be displayed in graphs and tables, but can be used as a comment to describe the nature of the line.
- **[<unit>]** is an optional unit description (e.g. kbit/s). If it is not provided the line is applied automatically to the scale of the first factory sensor channel. If your factory sensor uses different units you should provide a unit to make sure the line is added for the right scale. Please enter the unit exactly as shown in your graphs' legend. If you enter a unit that does not yet exist in your graph, a new scale will be added automatically.
- **<value>** contains a number defining where the line will be shown in the graph.

### Examples

```
#5:Line at 100ms [ms]
100
```

This channel definition will result in graph showing a horizontal line at the value of **100** on the **ms** scale.

```
#6:Line at 2 Mbit/s [kbit/s]
2000
```

This channel definition will result in graph showing a horizontal line at the value of **2000** on the **kbit/s** scale.

```
#1:Ping Time
channel(2002,0)
#2:Line at 120ms [ms]
120
```

This full channel definition will result in a factory sensor showing the **Ping Time** channel (channel ID **0**) of a Ping sensor (sensor ID **2002**). Additionally, the sensor's graphs will show a horizontal line at **120 ms**.

## Define Sensor Channels—Constants

The following constants are defined and can be used in calculations:

- **one** = 1
- **kilo** = 1000
- **mega** = 1000 \* kilo
- **giga** = 1000 \* mega
- **tera** = 1000 \* giga
- **byte** = 1
- **kilobyte** = 1024
- **megabyte** = 1024 \* kilobyte
- **gigabyte** = 1024 \* megabyte
- **terabyte** = 1024 \* gigabyte
- **bit** = 1/8
- **kilobit** = kilo / 8

- **megabit** = mega / 8
- **gigabit** = giga / 8
- **terabit** = tera / 8

## Define Sensor Status—status() Function

The status of a Sensor Factory sensor can be controlled by the **Status Definition** text field, if the custom formula option is enabled in the [Sensor Settings](#)<sup>856</sup>. Using a special syntax you can define when the factory sensor will change to a **Down** status. In all other cases the sensor will be in an **Up** status. The syntax is:

```
status(sensorID) <boolean> status(sensorID)
```

The parameters are:

- **<sensorid>** is the ID of the sensor you want to check the status of. The ID is displayed on the sensor details page, in the **Overview** tab behind the sensor name.
- **<boolean>** is one of the Boolean operators **AND**, **OR**, or **NOT**. If the resulting expression is **true**, the factory sensor will change to a **Down** status.

**Examples**

```
status(2031) AND status(2044)
```

This will change the factory sensor to a **Down** status if both sensors, with IDs **2031** and **2044**, are **Down**. Otherwise the factory sensor will show an **Up** status.

```
status(2031) OR status(2044)
```

This will change the factory sensor to a **Down** status if at least one of the sensors with ID **2031** or ID **2044** is **Down**. Otherwise the factory sensor will show an **Up** status.

```
status(2031) AND NOT status(2044)
```

This will change the factory sensor to a **Down** status if the sensor with ID **2031** is **Down**, but the sensor with ID **2044** is **not** in a **Down** status. Otherwise the factory sensor will show an **Up** status.

- **Note:** A status() function with **NOT** has to be connected with **AND** or **OR** if it is combined with other status() functions:

```
status(sensorID) AND NOT status(sensorID)
```

```
status(sensorID) OR NOT status(sensorID)
```

```
( status(2031) AND status(2044) ) OR status(2051)
```

This will change the factory sensor to a **Down** status if both the sensor with ID **2031** and the sensor with ID **2044** is **Down**, or if the sensor with ID **2051** is **Down**. Otherwise the factory sensor will show an **Up** status.

Additionally, the following elements are allowed to perform calculations and comparisons with the values that are returned by the status functions:

- Basic operations: + (add), - (subtract), \* (multiply), / (divide)  
Example: **3 + 5 \* 2**
- Brackets: ( )  
Example: **3 \* (2 + 6)**
- Compare: = (equal), <> (not equal), > (greater), < (less), >= (greater or equal), <= (less or equal)  
If the compare is true the value is **10,000**; if false the value is **0**. For delta sensors the speed is compared.

Internally, the status() function returns the downtime channel of the sensor in hundreds of percent (10,000 = 100%).

- **true** corresponds to a value of 10,000 which is a **Down** status.
- **false** corresponds to a value of 0 which is an **Up** status.

Understanding this, more complex formulas are possible.

### Example

```
( status(1031) + status(1032) + status(1033) + status(1034) ) >= 20000
```

This will change the factory sensor to a **Down** status if at least any two of the sensors with IDs **1031**, **1032**, **1033**, or **1034** are **Down**. Otherwise the factory sensor will show an **Up** status.

**Note:** The `status()` function may also be used in [channel definitions](#)<sup>[86]</sup>. Using this functionality, it is for example possible to display the numeric status value of sensors in a factory sensor channel.

## Using Factory Sensors in a Cluster Setup

If you're running PRTG in [Clustering](#)<sup>[81]</sup> mode, please note these additional facts:

- If you add a Sensor Factory sensor underneath the **Cluster Probe**, and in the Sensor Factory formula, you refer to a channel of a sensor running on the **Cluster Probe** as well, the Sensor Factory sensor will show the data of all cluster nodes for this sensor channel.
- If you add a Sensor Factory sensor underneath the **Local Probe**, and in the Sensor Factory formula, you refer to a channel of a sensor running on the **Cluster Probe**, the Sensor Factory sensor will only show data of the primary master node for this sensor channel.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.82 sFlow Sensor

The sFlow sensor receives traffic data from a sFlow V5 compatible device and shows the traffic by type. Only header traffic will be analyzed. Please make sure the device matches the sFlow version V5! There are several filter options available to divide traffic into different channels.

**Note:** In order for the sensor to work, sFlow V5 export must be enabled on the device. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).

The sensor accepts RAW data only. The stream must be sent via IPv4. This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

For a general introduction to the technology behind flow monitoring, please see [Monitoring Bandwidth via Flows](#)<sup>1966</sup> section.

### Limitations of This Sensor Type

There are some limitations that you want to consider before using this sensor type:

- Only sFlow version 5 datagrams are supported
- Only IPv4 flows are supported
- Only the "raw packet header" format is supported
- Only the "Flow sample" format is supported. "Extended flow" and "Counter" formats cannot be processed
- PRTG processes only samples where the source ID matches the ifIndex of the input interface (avoiding double counted traffic) and ascending sequence numbers. Due to internal limitations, only interface numbers up to 65535 are supported.
- Sample packets have to be of ethernet type "IP" (with optional VLAN tag)
- Sampled packets of type TCP and UDP are supported

We recommend using sFlow tester for debugging (see **More** section below).

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
sFlow Specific Settings	
Receive sFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the sFlow export options of your hardware router device. Default value is <b>6343</b> . Please enter an integer value. <b>Note:</b> When configuring export, please make sure you select the appropriate sFlow version 5.
Sender IP	Enter the IP address of the sending device you want to receive the sFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive sFlow Packets on IP	Select the IP address(es) on which PRTG listens to sFlow packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address selected here must match the one configured in the sFlow export options of your hardware router device. <b>Note:</b> When configuring export, please make sure you select the appropriate sFlow version 5.
Channel Configuration	
Channel Selection	Define the categories the traffic will be accounted to. There are different groups of traffic available. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Web:</b> Internet web traffic.</li> </ul>

### Channel Configuration

- **File Transfer:** Traffic caused by FTP.
- **Mail:** Internet mail traffic.
- **Chat:** Traffic caused by chat and instant messaging.
- **Remote Control:** Traffic caused by remote control applications, such as RDP, SSH, Telnet, VNC.
- **Infrastructure:** Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, SNMP.
- **NetBIOS:** Traffic caused by NetBIOS communication.
- **Other Protocols:** Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, i.e. how detailed traffic will be divided. For each group, choose between:

- **No:** Do not account traffic of this group in an own channel. All traffic of this group will be accounted to the default channel named **Other**.
- **Yes:** Count all traffic of this group and summarize it into one channel.
- **Detail:** Count all traffic of this group and further divide it into different channels. The traffic will appear in several channels as shown in the **Content** column. **Note:** Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

**Note:** You can change the default configuration for groups and channels. For details, please see section **More**.

### Filtering

#### Include Filter

Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see [Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors](#) <sup>2032</sup> section.

#### Exclude Filter

First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see [Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors](#) <sup>2032</sup> section.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Primary Toplist	
Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: <ul style="list-style-type: none"> <li>▪ <b>Top Talkers</b></li> <li>▪ <b>Top Connections</b></li> <li>▪ <b>Top Protocols</b></li> <li>▪ <b>[Any custom toplist you have added]</b></li> </ul>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail. For more information, please see [Toplists](#)<sup>1728</sup> section.

### 6.8.83 sFlow (Custom) Sensor

The sFlow (Custom) sensor receives traffic data from a sFlow V5 compatible device and shows the traffic by type. Please make sure the device matches the sFlow version V5! There are several filter options available to divide traffic into different channels.

**Note:** In order for the sensor to work, sFlow V5 export must be enabled on the device. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe). The sensor accepts RAW data. This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

For a general introduction to the technology behind flow monitoring, please see [Monitoring Bandwidth via Flows](#)<sup>1966</sup> section.

#### Limitations of This Sensor Type

There are some limitations that you want to consider before using this sensor type:

- Only sFlow version 5 datagrams are supported
- Only IPv4 flows are supported
- Only the "raw packet header" format is supported
- Only the "Flow sample" format is supported. "Extended flow" and "Counter" formats cannot be processed
- PRTG processes only samples where the source ID matches the ifIndex of the input interface (avoiding double counted traffic) and ascending sequence numbers. Due to internal limitations, only interface numbers up to 65535 are supported.
- Sample packets have to be of ethernet type "IP" (with optional VLAN tag)
- Sampled packets of type TCP and UDP are supported

We recommend using sFlow tester for debugging (see **More** section below).

#### Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>226</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
sFlow Specific Settings	
Receive sFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the sFlow export options of your hardware router device. Default value is <b>6343</b> . Please enter an integer value. <b>Note:</b> When configuring export, please make sure you select the appropriate sFlow version 5.
Sender IP	Enter the IP address of the sending device you want to receive the sFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive sFlow Packets on IP	Select the IP address(es) on which PRTG listens to sFlow packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address selected here must match the one configured in the sFlow export options of your hardware router device. <b>Note:</b> When configuring export, please make sure you select the appropriate sFlow version 5.

Channel Definition	Please enter a channel definition to divide the traffic into different channels. Write each definition in one line. For detailed information, please see <a href="#">Channel Definitions for xFlow and Packet Sniffer Sensors</a> <sup>[2036]</sup> section. All traffic for which no channel is defined will be accounted to the default channel named <b>Other</b> . <b>Note:</b> Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyse.
<b>Filtering</b>	
Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>[2032]</sup> section.
Exclude Filter	First, the filters defined in the <b>Include Filter</b> field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see <a href="#">Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors</a> <sup>[2032]</sup> section.
<b>Sensor Display</b>	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Primary Toplist****Primary Toplist**

Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:

- **Top Talkers**
- **Top Connections**
- **Top Protocols**
- **[Any custom toplist you have added]**

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

Schedules, Dependencies, and Maintenance Window	
	<ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

### Channel Unit Configuration

#### Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

**Note:** Custom channel types can be set on sensor level only.

### Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail. For more information, please see [Toplists](#) <sup>1728</sup> section.

## 6.8.84 SFTP Secure File Transfer Protocol Sensor

The sFTP Secure File Transfer Protocol sensor monitors FTP servers of a Linux/Unix system using SSH File Transfer Protocol (FTP over SSH). It tries to connect to a server and shows the response time.

For this sensor type credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems must be defined for the device you want to use the sensor on.

**Note:** Not all Linux/Unix and Mac OS distributions can be supported by this sensor type.

For a general introduction to SSH monitoring, please see [Monitoring via SSH](#)<sup>[1962]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings  
 84 SFTP Secure File Transfer Protocol Sensor

SSH Specific	
Connection Timeout (sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible.
Shell Timeout (sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. <code>cat /proc/loadavg</code> ).
SSH Port	<p>Define which port this sensor will use for the SSH connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherit port number from parent device (default):</b> Use the port number as defined in the <a href="#">Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems</a> section of the device this sensor is created on.</li> <li>▪ <b>Enter custom port number:</b> Do not use the port number from the parent device's settings, but define a different port number below.</li> </ul>
Use Port Number	This field is only visible if the custom port number setting is enabled above. Enter the port number this sensor will use for the SSH connection. Please enter an integer value.
Result Handling	<p>Define what will be done with the result data received by the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Discard result:</b> Do not store the result data.</li> <li>• <b>Write result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the query to the "Logs (Sensors)" directory (on the Master node, if in a cluster). File name: <code>Result of Sensor [ID].txt</code>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> <li>▪ <b>Show in and out traffic as positive and negative area chart:</b> Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) <sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.85 Share Disk Free Sensor

The Share Disk Free sensor monitors free disk space of a share (Windows/Samba) using Server Message Block (SMB). It shows the free space in percent and total.

**Note:** This sensor only works if no quotas are enabled on the target share. If there are quotas enabled for the user account this sensor uses to connect to the share, the absolute value will be okay, but the percentage variable will show wrong values.

### Requirement: Server Service

In order to monitor shares on Windows machines, please make sure the **LanmanServer** "Server" Windows service is running on the target computer.

To enable the service, please log in to the respective computer and open the services manager (e.g. via **services.msc**). In the list, find the respective service and set its **Start Type** to **Automatic**.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

### Basic Sensor Settings

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Share Configuration

Share	Enter the name of the share this sensor will monitor. Only a share name is allowed here (for example, enter C\$). Please do not enter a complete UNC name here. The server name (\\server\ ) is taken from the parent device of this sensor. <b>Note:</b> In order to provide any shares under Windows, the LanmanServer "Server" Windows service must be running on the target computer.
-------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <small>1709</small> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

**Schedules, Dependencies, and Maintenance Window**

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>941</sup>.

## 6.8.86 SIP Options Ping Sensor

The SIP Options Ping sensor monitors the connectivity for a Session Initiation Protocol (SIP) server using SIP options "Ping". It can be used to monitor voice-over-IP (VoIP) services. The sensor sends "auth" and "options" requests to the SIP server and shows the response time. It can alert in case of an error.

**Note:** A SIP server might return a **480 Service temporarily unavailable** error until at least one reachable SIP client is connected to the server.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
-------------	-------------------------------------------------------------------------------------------------------------------------

Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings  
86 SIP Options Ping Sensor

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
SIP Specific	
Port	Define the UDP port this sensor will connect to. Please enter an integer value.
Username	Enter the username of the SIP account this sensor will log into after a connection to the SIP server has been established. Please enter a string.
Password	Enter the password of the SIP account this sensor will log into after a connection to the SIP server has been established. Please enter a string.
Timeout (Seconds)	Enter the timeout for the connection to the SIP server. Please enter an integer value.
Retry Count	In case the connection to the SIP server fails, the sensor can re-try to connect. Enter the maximum number of retries. After reaching the maximum count the sensor will show a red <b>Down</b> status. Please enter an integer value.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor.

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>159</sup> to choose an object on which the current sensor will be dependent on.</p>

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.87 SMTP Sensor

The SMTP sensor monitors a mail server using Simple Mail Transfer Protocol (SMTP) and shows the server's response time. It can optionally send a test email with every check.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
SMTP specific	
Timeout (sec)	Enter a timeout in seconds for the SMTP connect. If the reply takes longer than this value the request is aborted and an error message is triggered.

Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings  
87 SMTP Sensor

SMTP specific	
Port	Enter the number of the port that will be used to send an email via SMTP. For non-secure connections usually port 25 is used; usually port 465 or 587 for SSL connections. The actual setting depends on the server you are connecting to. Please enter an integer value. We recommend using the default value. If you do not get a connection, please try another port number.
TLS (Transport-Level Security)	<p>Select if the SMTP connection will be secured via SSL. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Don't use:</b> Do not use encryption for the SMTP connection.</li> <li>• <b>Use:</b> Connect to the SMTP server using the SSL method selected below.</li> </ul>
SSL-Method	<p>This field is only visible if security is enabled above. Select the SSL method that will be used when connecting to the server. We recommend using the default value. Only if you experience connection problems, try another setting. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>SSL V2</b></li> <li>▪ <b>SSL V2 or V3</b></li> <li>▪ <b>SSL V3</b></li> <li>▪ <b>TLS V1</b></li> </ul>
Authentication	
Type	<p>Select whether to use an authentication method for the SMTP connection. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>None:</b> Do not use any authentication method.</li> <li>• <b>Username/Password:</b> Authenticate at the SMTP server via username and password.</li> </ul>
Username	This field is only visible if SMTP authentication is enabled above. Enter a username for SMTP authentication. Please enter a string.
Password	This field is only visible if SMTP authentication is enabled above. Enter a password for SMTP authentication. Please enter a string.

Monitoring	
Send Mail	<p>Define if an email will be sent when connecting to the SMTP server. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>None:</b> Do not send an email, just connect to the SMTP server.</li> <li>• <b>Send Mail:</b> Send an email through the SMTP server. If there is an error when sending mail, an error message will be triggered and the sensor will change to a <b>Down</b> status.</li> </ul>
Helo Ident	Enter a server name for the helo part of the mail protocol. For some mail servers the helo ident must be the valid principal host domain name for the client host.
From	Specify which address the sent emails will contain in the from field. Please enter a valid email address.
To	Specify to which address the emails will be sent to. Please enter a valid email address.
Topic	Specify which subject will be used in the sent emails. Please enter a string or leave the field empty.
Content	Specify which body will be used in the sent emails. Please enter a string or leave the field empty.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

**Notifications**

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

**Others**

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.88 SMTP&IMAP Round Trip Sensor

The SMTP&IMAP Round Trip sensor monitors the time it takes for an email to reach an Internet Message Access Protocol (IMAP) mailbox after being sent using Simple Mail Transfer Protocol (SMTP). It sends an email to the parent device via SMTP and then scans a dedicated IMAP mailbox until this email comes in. The sensor shows the response time of SMTP and IMAP server, and the sum of both.

The SMTP&IMAP Round Trip sensor will delete these emails automatically from the mailbox as soon as PRTG retrieves them. Emails will only remain in the mailbox particularly if a timeout or a restart of the PRTG server occurred during sensor run-time.

**Note:** Please use dedicated email accounts with this sensor type. If you use more sensors of this type, please make sure that each sensor uses its own email accounts.

For a general introduction to the technology behind round trip monitoring, please see [Monitoring Email Round Trip](#)<sup>1975</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

We recommend adding this sensor on an SMTP server device only, because this sensor type's settings are optimized for this scenario.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>89</sup> from objects further up in the device tree. Those are not visible here.

### Basic Sensor Settings

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Sensor Result	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <b>Result of Sensor [ID].txt</b>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <small>2074</small> section.</li> </ul>
---------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Email Settings

From	Specify which address the sent emails will contain in the from field. Please enter a valid email address.
To	Specify to which address the emails will be sent to. Please enter a valid email address.
Helo Ident	Enter a server name for the helo part of the mail protocol. For some mail servers the helo ident must be the valid principal host domain name for the client host.

**Step 1: Send Email to Parent Device Using SMTP**

In this step, you configure how emails will be sent. As SMTP server, the sensor uses the **IP-Address/DNS Name** property's value of the device it is added on.

Port	Enter the number of the port that will be used to send an email via SMTP. Please enter an integer value. For non-secure connections usually port 25 is used; usually port 465 or 587 for SSL connections. The actual setting depends on the server you are connecting to. Please enter an integer value. We recommend using the default value. If you do not get a connection, please try another port number.
Timeout for SMTP Connection (Sec.)	Enter a timeout in seconds for the SMTP connect. If the reply takes longer than this value the request is aborted and an error message is triggered.
TLS (Transport-Level Security)	Select if the SMTP connection will be secured via SSL. Choose between: <ul style="list-style-type: none"> <li>• <b>Don't use:</b> Do not use encryption for the SMTP connection.</li> <li>• <b>Use:</b> Connect to the SMTP server using the SSL method selected below.</li> </ul>
SSL-Method	This field is only visible if security is enabled above. Select the SSL method that will be used when connecting to the server. We recommend using the default value. Only if you experience connection problems, try another setting. Choose between: <ul style="list-style-type: none"> <li>▪ <b>SSL V2</b></li> <li>▪ <b>SSL V2 or V3</b></li> <li>▪ <b>SSL V3</b></li> <li>▪ <b>TLS V1</b></li> </ul>
SMTP Authentication Type	Define if you want to use an authentication for the SMTP connection. Choose between: <ul style="list-style-type: none"> <li>• <b>None:</b> Do not use any authentication method.</li> <li>• <b>Username/Password:</b> Authenticate at the SMTP server via username and password.</li> </ul>
Username	This field is only visible if SMTP authentication is enabled above. Enter a username for SMTP authentication. Please enter a string.
Password	This field is only visible if SMTP authentication is enabled above. Enter a password for SMTP authentication. Please enter a string.
Additional Text for Email Subject	The subject part of the round trip email is created automatically by PRTG. It consists of the string "PRTG Roundtrip Mail:" followed by a unique GUID to correctly identify the email in the IMAP mailbox (e.g. <b>PRTG Roundtrip Mail: {5E858D9C-AC70-466A-9B2A-55630165D276}</b> ). Use this field to place your custom text before the automatically created text.

### Step 2: Check an IMAP Mailbox Until Email Arrives

In this step, you configure how the sent emails will be received.

IP-Address/DNS Name	Specify the IMAP server. Enter a valid IP address or DNS name.
Mailbox	Specify the IMAP Mailbox (resp. "IMAP folder") you want to check. Please enter the IMAP mailbox/folder name.
Port	Specify the port that will be used for the IMAP connection. For non-secure connections usually port 143 is used; usually port 993 for SSL connections. The actual setting depends on the server you are connecting to. Please enter an integer value. We recommend using the default value. If you do not get a connection, please try another port number.
TLS (Transport-Level Security)	<p>Select if the IMAP connection will be secured via SSL. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Don't use:</b> Do not use encryption for the SMTP connection.</li> <li>• <b>Use:</b> Connect to the SMTP server using the SSL method selected below.</li> </ul>
SSL-Method	This field is only visible when TLS is enabled above. Select the SSL method that will be used when connecting to the IMAP server. We recommend using the default value. If you experience connection problems, try another setting.
Connection Interval (Sec.)	Enter the number of seconds the sensor will wait between two connections to the IMAP server. PRTG will repeatedly check the mailbox in this interval until the email arrives. Please enter an integer value.
Maximum Trip Time (Sec.)	Enter the number of seconds an email may take to arrive in the IMAP mailbox. PRTG will repeatedly check the mailbox in the interval specified above until the email arrives. If it does not arrive within the maximum trip time, an error message will be triggered for the sensor. Please enter an integer value.
IMAP Authentication Type	<p>Select the kind of authentication for the IMAP connection. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Username and Password (simple)</b></li> <li>• <b>Simple Authentication and Security Layer (SASL)</b></li> </ul>
Username	Enter a username for IMAP authentication. Please enter a string.
Password	Enter a password for IMAP authentication. Please enter a string.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <small>1817</small>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.89 SMTP&POP3 Round Trip Sensor

The SMTP&POP3 Round Trip sensor monitors the time it takes for an email to reach an Post Office Protocol version 3 (POP3) mailbox after being sent using Simple Mail Transfer Protocol (SMTP). It sends an email to the parent device via SMTP and then scans a dedicated POP3 mailbox until the email comes in. The sensor shows the response time of SMTP and POP3 server, and the sum of both.

The SMTP&POP3 Round Trip sensor will delete these emails automatically from the mailbox as soon as PRTG retrieves them. Emails will only remain in the mailbox particularly if a timeout or a restart of the PRTG server occurred during sensor run-time.

**Note:** Please use dedicated email accounts with this sensor type. If you use more sensors of this type, please make sure that each sensor uses its own email accounts.

For a general introduction to the technology behind round trip monitoring, please see [Monitoring Email Round Trip](#)<sup>1975</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

We recommend adding this sensor on an SMTP server device only, as the sensor's settings are optimized for this scenario.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>89</sup> from objects further up in the device tree. Those are not visible here.

**Basic Sensor Settings****Priority**

Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Sensor Result**

Define what will be done with the result of the sensor. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: **Result of Sensor [ID].txt**. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see [Data Storage](#) 2074 section.

**Email Settings****From**

Specify which address the sent emails will contain in the from field. Please enter a valid email address.

**To**

Specify to which address the emails will be sent to. Please enter a valid email address.

**Helo Ident**

Enter a server name for the helo part of the mail protocol. For some mail servers the helo ident must be the valid principal host domain name for the client host.

**Step 1: Send Email to the Parent Device Using SMTP**

In this step, you configure how emails will be sent. As SMTP server, the sensor uses the **IP-Address/DNS Name** property's value of the device it is added on.

Port	Enter the number of the port that will be used to send an email via SMTP. Please enter an integer value. For non-secure connections usually port 25 is used; usually port 465 or 587 for SSL connections. The actual setting depends on the server you are connecting to. Please enter an integer value. We recommend using the default value. If you do not get a connection, please try another port number.
Timeout for SMTP Connection (Sec.)	Enter a timeout in seconds for the SMTP connect. If the reply takes longer than this value the request is aborted and an error message is triggered.
TLS (Transport-Level Security)	<p>Select if the SMTP connection will be secured via SSL. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Don't use:</b> Do not use encryption for the SMTP connection.</li> <li>• <b>Use:</b> Connect to the SMTP server using the SSL method selected below.</li> </ul>
SSL-Method	<p>This field is only visible if security is enabled above. Select the SSL method that will be used when connecting to the server. We recommend using the default value. Only if you experience connection problems, try another setting. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>SSL V2</b></li> <li>▪ <b>SSL V2 or V3</b></li> <li>▪ <b>SSL V3</b></li> <li>▪ <b>TLS V1</b></li> </ul>
SMTP Authentication Type	<p>Define if you want to use an authentication for the SMTP connection. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>None:</b> Do not use any authentication method.</li> <li>• <b>Username/Password:</b> Authenticate at the SMTP server via username and password.</li> </ul>

Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings  
89 SMTP&POP3 Round Trip Sensor

Username	This field is only visible if SMTP authentication is enabled above. Enter a username for SMTP authentication. Please enter a string.
Password	This field is only visible if SMTP authentication is enabled above. Enter a password for SMTP authentication. Please enter a string.
Additional Text for Email Subject	The subject part of the round trip email is created automatically by PRTG. It consists of the string "PRTG Roundtrip Mail:" followed by a unique GUID to correctly identify the email in the POP3 mailbox (e.g. <b>PRTG Roundtrip Mail: {5E858D9C-AC70-466A-9B2A-55630165D276}</b> ). Use this field to place your custom text before the automatically created text.

**Step 2: Check a POP3 Mailbox Until Email Arrives**

In this step, you configure how the sent emails will be received.

IP-Address/DNS Name	Specify the POP3 server. Enter a valid IP address or DNS name.
Port	Specify the port that will be used for the POP3 connection. For non-secure connections usually port 110 is used; usually port 995 for SSL connections. The actual setting depends on the server you are connecting to. Please enter an integer value. We recommend using the default value. If you do not get a connection, please try another port number.
TLS (Transport-Level Security)	<p>Select if the POP3 connection will be secured via SSL. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Don't use:</b> Do not use encryption for the SMTP connection.</li> <li>• <b>Use:</b> Connect to the SMTP server using the SSL method selected below.</li> </ul>
SSL-Method	This field is only visible when TLS is enabled above. Select the SSL method that will be used when connecting to the IMAP server. We recommend using the default value. If you experience connection problems, try another setting.
Connection Interval (Sec.)	Enter the number of seconds the sensor will wait between two connections to the IMAP server. PRTG will repeatedly check the mailbox in this interval until the email arrives. Please enter an integer value.
Maximum Trip Time (Sec.)	Enter the number of seconds an email may take to arrive in the IMAP mailbox. PRTG will repeatedly check the mailbox in the interval specified above until the email arrives. If it does not arrive within the maximum trip time, an error message will be triggered for the sensor. Please enter an integer value.
POP3 Authentication Type	<p>Select the kind of authentication for the POP3 connection. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Without Login:</b> Monitor the connection to the POP3 server only.</li> <li>• <b>Username and Password:</b> Log into the POP3 server with user name and password (simple login, non-secure).</li> <li>• <b>128-bit MD5 hash value (APOP):</b> Send the password in an encrypted form using APOP. This option must be supported by the POP3 server you're connecting to.</li> </ul>
Username	This field is only visible if an option with login is selected above. Enter a username for POP3 authentication. Please enter a string.
Password	This field is only visible if an option with login is selected above. Enter a password for POP3 authentication. Please enter a string.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.90 SNMP APC Hardware Sensor

The SNMP APC Hardware sensor monitors performance counters on an APC UPS device using Simple Network Management Protocol (SNMP). It can show actual voltage of a battery, its capacity and temperature, and its remaining runtime, the input and output frequency, input and output voltage, and output load. For additional counters, please see section [More](#)<sup>932</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>1936</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

For devices with multiple performance counters multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

APC UPS Specific	
Library OIDs	Select the performance counters you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>1716</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
APC UPS Specific	
Selected Interface	Shows the name of the interface (performance counter) monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Unit String	Define the unit of the numerical data that will be received at the given OID. Please enter a string.
Multiplication	If you want to multiply the received data with a certain value, enter the quotient here. Please enter an integer or float value.
Division	If you want to divide the received data by a certain value, enter the divisor here. Please enter an integer or float value.
If Value Changes	<p>Define what shall be done in case the value of this sensor changes. You can choose between:</p> <ul style="list-style-type: none"> <li>• <b>Ignore changes:</b> No action will be taken on change.</li> <li>• <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a><sup>1716</sup> whenever the sensor value changes.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <small>1817</small> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## More

Knowledge Base: How can I monitor additional counters with the SNMP APC Hardware sensor?

- <http://kb.paessler.com/en/topic/60367>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.91 SNMP Cisco ADSL Sensor

The SNMP Cisco ADSL sensor monitors Asymmetric Digital Subscriber Line (ADSL) statistics of a Cisco router using Simple Network Management Protocol (SNMP). It shows the speed of downlink and uplink, remote and local attenuation, remote and local SNR (signal-to-noise ratio), and remote and local power output.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

For devices with multiple performance counters, multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Cisco ADSL Settings	
Line Index	Select the performance counters you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <a href="#">Vertical Axis Scaling</a> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>[224]</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

### Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#) <sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#) <sup>94</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#) <sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#) <sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#) <sup>142</sup> section.

## 6.8.92 SNMP Cisco ASA VPN Connections Sensor

The SNMP Cisco ASA VPN Connections sensor monitors the Virtual Private Network (VPN) connections on a Cisco Adaptive Security Appliance using Simple Network Management Protocol (SNMP). It shows the active sessions of the connection types email, IPsec, L2L, LB, SVC, WebVPN, as well as the total number of sessions, active users, and groups with active users.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>1986</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>89</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <small>1817</small>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.93 SNMP Cisco ASA VPN Traffic Sensor

The SNMP Cisco ASA VPN Traffic sensor monitors the traffic of an Internet Protocol Security (IPsec) Virtual Private Network (VPN) connection on a Cisco Adaptive Security Appliance using Simple Network Management Protocol (SNMP). It shows incoming and outgoing traffic, as well as total traffic.

This sensor type is indented to monitor permanent connections. It will show an error if a connection is interrupted. It can monitor IPsec connections only!

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

If you select more than one connections, multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### ASA VPN Specific

Connections	Select the IPsec VPN connections you want to add a sensor for. You see a list of all active IPsec VPN connections available on the target ASA, listed with remote IP, user name, and the kind of connection. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head. <b>Note:</b> This sensor type can only monitor VPN connections based on <b>IPsec</b> . This means, for example, that connections using "Cisco AnyConnect" will not be listed here.
-------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
ASA VPN Specific	
Remote IP	The IP address of the connection this sensor monitors. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew. <b>Note:</b> This sensor type can only monitor VPN connections based on <b>IPsec</b> .
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>941</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.94 SNMP Cisco ASA VPN Users Sensor

The SNMP Cisco ASA VPN Users sensor monitors account connections to a Virtual Private Network (VPN) on a Cisco Adaptive Security Appliance via Simple Network Management Protocol (SNMP). It can show the number of currently connected accounts and if a user account is currently offline or online.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>1986</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>89</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <small>1817</small> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.95 SNMP Cisco CBQoS Sensor

The SNMP Cisco CBQoS sensor monitors network parameters using Cisco's Class Based Quality of Service (CBQoS) via Simple Network Management Protocol (SNMP). It supports the classes Class Map, Match Statement, and Queueing. The sensor shows current and maximum queue depth, pre policy packets, pre and post policy size, drop packets and size, drop packets without buffer, as well as fragment packets and size, depending on the particular class type.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>1986</sup> section.

For a general introduction to the technology behind Quality of Service monitoring, please see [Monitoring Quality of Service](#) <sup>1971</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor quality-of-service via compatible devices, PRTG will create one sensor for each CBQoS entry you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Class Based QoS Specific	
CBQoS Entries	Select the measurements you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

### Basic Sensor Settings

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### Class Based QoS Specific

Interface	Shows further information about the parameter this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	
Bitmask	
ObjectID	
ConfigID	

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>[1839]</sup> .
-------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>[224]</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>94</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.96 SNMP Cisco System Health Sensor

The SNMP Cisco System Health sensor monitors the system health of a Cisco device via Simple Network Management Protocol (SNMP). It can show the percentage CPU load, available memory in absolute and percentage values, the status of power supplies, temperatures (in Celsius), the current temperature states, and many more, depending on the available components of your device.

This sensor type has predefined limits for several metrics. These limits can be changed individually in the channel settings. For detailed information about channel limits please refer to the section [Sensor Channels Settings](#)<sup>[1709]</sup>.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>[2039]</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>[1955]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the system health of a Cisco device, PRTG will create one sensor for each measurement you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Cisco System Health Specific	
Measurement	Select the measurements you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings**

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Cisco System Health Specific**

Measurement	Shows the ID of the measurement that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
-------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[170]</sup> settings).</li> </ul>

Sensor Display	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.
Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) <sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.97 SNMP Cisco UCS Chassis Sensor

The SNMP Cisco UCS Chassis sensor monitors the health status of the chassis of a Cisco Unified Computing and Server (UCS) device via Simple Network Management Protocol (SNMP). It can show the states of configuration, license, oper, the operability, power status, thermal status, as well as the serial electronic erasable programmable read-only memory (SEEPROM) status. The creation of these channels depends on the available measurement components on the UCS chassis.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#) <sup>2039</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>1986</sup> section.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the health status of a Cisco UCS chassis, PRTG will create one sensor for each chassis you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
Chassis	Select the chassis you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings**

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Sensor Settings**

Chassis	Shows the chassis monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
---------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[170]</sup> settings).</li> </ul>

### Sensor Display

#### Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

#### Scanning Interval

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

#### Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

#### Maintenance Window

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.98 SNMP Cisco UCS Physical Disk Sensor

The SNMP Cisco UCS Physical Disk sensor monitors a physical disk of a Cisco Unified Computing and Server (UCS) device via Simple Network Management Protocol (SNMP). It can show the operability status of the disk, as well as if the monitored disk is still connected.

**Important notice:** Currently, this sensor type is in **beta** status. The methods of operating can change at any time, as well as the available settings. **Do not expect** that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>2039</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>1995</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor physical disks in a UCS device, PRTG will create one sensor for each disk you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

UCS Physical Disk	
Disks	<p>Select the disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.</p> <p><b>Note:</b> Only working disks (with the current status <b>Up</b> or <b>Warning</b>) will be shown here.</p>

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

UCS Physical Disk	
Disk	Shows the disk which this sensor monitors. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Display Name	Shows the display name of the physical disk which this sensor monitors. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

### Channel Unit Configuration

#### Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

**Note:** Custom channel types can be set on sensor level only.

### Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

### Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

### Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.99 SNMP Cisco UCS System Health Sensor

The SNMP Cisco UCS System Health sensor monitors the system health of a Cisco Unified Computing and Server (UCS) device via Simple Network Management Protocol (SNMP). It can show the following: the number of operable resp. inoperable fans, the status of fan performance, fan thermal and fan voltage, and if a fan failure is predicted; the number of operable resp. inoperable fan modules, the status of fan module performance, fan module thermal and fan module voltage, and if a fan module failure is predicted; the number of operable resp. inoperable power supplies, the status of power supply performance, power supply thermal and power supply voltage, and if a power supply failure is predicted.

The creation of these channels depends on the available measurement components in the UCS device.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#) <sup>2039</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>1986</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>89</sup> from objects further up in the device tree. Those are not visible here.

**Basic Sensor Settings**

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval**

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.100 SNMP CPU Load Sensor

The SNMP CPU Load sensor monitors the system load using Simple Network Management Protocol (SNMP). It can show the load of several CPUs in percent.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a>  from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

#### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
-----------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Sensor Display	
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>

Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1812</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.101 SNMP Custom Sensor

The SNMP Custom sensor monitors a numerical value returned by a specific OID using Simple Network Management Protocol (SNMP).

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

OID values	
Channel Name	Enter a name for the channel the results at the given OID will be will shown in. You can change this value later in the sensor's <a href="#">channel settings</a>  .
Value Type	<p>Select how the results at the given OID will be handled. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Gauge (unsigned Integer):</b> For integer values, such as <b>10</b> or <b>120</b>.</li> <li>▪ <b>Gauge (signed integer):</b> For integer values, such as <b>-12</b> or <b>120</b>.</li> <li>▪ <b>Gauge (float):</b> For float values, such as <b>-5.80</b> or <b>8.23</b>.</li> <li>▪ <b>Delta (Counter):</b> For counter values. PRTG will calculate the difference between the last and the current value.</li> </ul> <p>Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

OID values	
OID value	Enter the OID of the SNMP object you want to receive numerical data from. <b>Note:</b> Most OIDs begin with <b>1.3.6.1</b> . However, entering OIDs starting with <b>1.0</b> , or <b>1.1</b> , or <b>1.2</b> is also allowed. If you want to disable the validation of your entry entirely, add the string <b>norfccheck:</b> at the beginning of your OID, for example, <b>norfccheck:2.0.0.0.1</b> .
Unit String	Define the unit of the numerical data that will be received at the given OID. Please enter a string.
Value Type	Shows the value type of the numerical data that will be received at the given OID. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Multiplication	If you want to multiply the received data with a certain value, enter the quotient here. Please enter an integer or float value.
Division	If you want to divide the received data by a certain value, enter the divisor here. Please enter an integer or float value.
If value changes	Define what shall be done in case the value of this sensor changes. You can choose between: <ul style="list-style-type: none"> <li>• <b>Ignore changes (default):</b> No action will be taken on change.</li> <li>• <b>Trigger 'On Change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <sup>1716</sup> whenever the sensor value changes.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## More

Knowledge Base: How do I find out what OID I need to use for a custom sensor?

- <http://kb.paessler.com/en/topic/903>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.102 SNMP Custom String Sensor

The SNMP Custom String sensor monitors a string returned by a specific OID using Simple Network Management Protocol (SNMP). It can check for keywords. If you want to use limits for the sensor channel value, you can also extract a numeric value contained in the string.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>[195]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

OID Values	
OID Value	Enter the OID of the SNMP object you want to receive a string from. <b>Note:</b> Most OIDs begin with <b>1.3.6.1</b> . However, entering OIDs starting with <b>1.0</b> , or <b>1.1</b> , or <b>1.2</b> is also allowed. If you want to disable the validation of your entry entirely, add the string <b>norfccheck</b> : at the beginning of your OID, for example, <b>norfccheck:2.0.0.0.1</b> .
Maximum Length of String	Define the maximum length of the string that will be received from the SNMP object at the given OID. If the string is longer than this value, the sensor will be set to an error status. Please enter an integer value or leave the field empty.
If Value Changes	Define what shall be done in case the value of this sensor changes. You can choose between: <ul style="list-style-type: none"><li>• <b>Ignore changes (default):</b> No action will be taken on change.</li><li>• <b>Trigger 'On Change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <sup>1716</sup> whenever the sensor value changes.</li></ul>

Keyword Search	
Response Must Include (Error State)	Define which string must be part of the data that is received from the SNMP object at the given OID. You can either enter plain text or a <a href="#">Regular Expression</a> . If the data does not include the search pattern, the sensor will be set to an <b>error</b> state. Please enter a string or leave the field empty.
For Keyword Search Use	Define in which format you have entered the search expression in the field above. <ul style="list-style-type: none"> <li>▪ <b>Plain Text:</b> Search for the string as plain text. The characters <b>*</b> and <b>?</b> work here as placeholder, whereas <b>*</b> stands for no or any number of characters and <b>?</b> stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search.</li> <li>▪ <b>Regular Expression:</b> Treat the search pattern as a <a href="#">Regular Expression</a>.</li> </ul>
Response Must Not Include (Error State)	Define which string must <b>not</b> be part of the data that is received from the SNMP object at the given OID. You can either enter plain text or a <a href="#">Regular Expression</a> . If the data does include the search pattern, the sensor will be set to an <b>error</b> state. Please enter a string or leave the field empty.
For Keyword Search Use	Define in which format you have entered the search expression in the field above. <ul style="list-style-type: none"> <li>▪ <b>Plain Text:</b> Search for the string as plain text. The characters <b>*</b> and <b>?</b> work here as placeholder, whereas <b>*</b> stands for no or any number of characters and <b>?</b> stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search.</li> <li>▪ <b>Regular Expression:</b> Treat the search pattern as a <a href="#">Regular Expression</a>.</li> </ul>
Response Must Include (Warning State)	Define which string must be part of the data that is received from the SNMP object at the given OID. You can either enter plain text or a <a href="#">Regular Expression</a> . If the data does not include the search pattern, the sensor will be set to a <b>warning</b> state. Please enter a string or leave the field empty.
For Keyword Search Use	Define in which format you have entered the search expression in the field above. <ul style="list-style-type: none"> <li>▪ <b>Plain Text:</b> Search for the string as plain text. The characters <b>*</b> and <b>?</b> work here as placeholder, whereas <b>*</b> stands for no or any number of characters and <b>?</b> stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search.</li> <li>▪ <b>Regular Expression:</b> Treat the search pattern as a <a href="#">Regular Expression</a>.</li> </ul>
Response Must Not	Define which string must <b>not</b> be part of the data that is received

Extended Processing	
Extract Number Using Regular Expression	<p>Define if you want to filter out a numeric value from the string received from the SNMP object at the given OID. You can convert this into a float value in order to use it with channel limits (see <a href="#">Sensor Channels Settings</a> <sup>1709</sup>).</p> <ul style="list-style-type: none"> <li>▪ <b>No extraction:</b> Do not extract a float value. Use the result as a string value.</li> <li>▪ <b>Extract a numeric value using a regular expression:</b> Use a regular expression to identify a numeric value in the string and convert it to a float value. Define below. See also the <a href="#">example</a> <sup>1000</sup> below.</li> </ul>
Regular Expression	<p>This setting is only visible if number extraction is enabled above. Enter a <a href="#">Regular Expression</a> <sup>2048</sup> to identify the numeric value you want to extract from the string returned by the SNMP object at the given OID. You can use capturing groups here. Make sure the expression returns numbers only (including decimal and thousands separators). The result will be further refined by the settings below.</p>
Index of Capturing Group	<p>This setting is only visible if number extraction is enabled above. If your regular expression uses capturing groups, please specify which one will be used to capture the number. Please enter an integer value or leave the field empty.</p>
Decimal Separator	<p>This setting is only visible if number extraction is enabled above. Define which character is used as decimal separator for the number extracted above. Please enter a string or leave the field empty.</p>
Thousands Separator	<p>This setting is only visible if number extraction is enabled above. Define which character is used as thousands separator for the number extracted above. Please enter a string or leave the field empty.</p>
Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Example: Number Extraction with Regular Expression**

If you want to extract a number in the response string using a regular expression, please note that the index for captures in this sensor is based on **1 (not on 0)**. Furthermore, capturing groups are not created automatically. The example below will illustrate this issue.

Consider the following string as returned by a request for CPU usage:

```
5 Sec (3.49%), 1 Min (3.555%), 5 Min (3.90%)
```

Assuming you would like to filter for the number **3.555**, i.e., the percentage in the second parentheses. Then enter the following regex in the **Regular Expression** field:

```
(\d+\.\d+).* (\d+\.\d+).* (\d+\.\d+)
```

As **Index of Capturing Group** enter **3**. This will extract the desired number 3.555.

The index has to be 3 in this case because the capturing groups here are the following:

- Group 1 contains "3.49%, 1 Min (3.555), 5 Min (3.90"
- Group 2 contains "3.49"
- Group 3 contains "3.555"
- Group 4 contains "3.90"

Please keep in mind this note about index and capturing groups when using number extraction.

## More

Knowledge Base: How do I find out what OID I need to use for a custom sensor?

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.103 SNMP Dell Hardware Sensor

The SNMP Dell Hardware sensor monitors performance counters on a Dell hardware device using Simple Network Management Protocol (SNMP).

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

For devices with multiple performance counters multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Dell Hardware Specific	
Library OIDs	Select the performance counters you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>1716</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Dell Hardware Specific	
Selected Interface	Shows the name of the interface (performance counter) monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Unit String	Define the unit of the numerical data that will be received at the given OID. Please enter a string.
Multiplication	If you want to multiply the received data with a certain value, enter the quotient here. Please enter an integer or float value.
Division	If you want to divide the received data by a certain value, enter the divisor here. Please enter an integer or float value.
If Value Changes	<p>Define what shall be done in case the value of this sensor changes. You can choose between:</p> <ul style="list-style-type: none"> <li>• <b>Ignore changes:</b> No action will be taken on change.</li> <li>• <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a><sup>1716</sup> whenever the sensor value changes.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.104 SNMP Dell PowerEdge Physical Disk Sensor

The SNMP Dell PowerEdge Physical Disk sensor monitors a physical disk in a Dell PowerEdge server using Simple Network Management Protocol (SNMP). It can show the disk status, the roll up status, the component status, as well as if there is currently a warning regarding the Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.) status.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#) <sup>2039</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>1950</sup> section.

### Requirement: Dell OpenManage Server Administrator or iDRAC 7

This sensor needs the Dell OpenManage Server Administrator tool to be installed on the device in order to monitor PowerEdge servers. Please make sure that you enable SNMP in the OpenManage Server Administrator. For details, please see section **More** below. **Note:** You can also monitor Dell PowerEdge servers with this sensor type via Integrated Dell Remote Access Controller (iDRAC) 7.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>2201</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor physical disks in a Dell PowerEdge server, PRTG will create one sensor for each disk. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### Dell PowerEdge Physical Disk Settings

##### Disk

Select the disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings**

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Dell PowerEdge Physical Disk Settings**

Disk	Shows the name of the disk that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Data Source	Shows the interface which is used to get monitoring data. This is either Dell OpenManage Server Administrator (OMSA) or Integrated Dell Remote Access Controller (iDRAC).

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[170]</sup> settings).</li> </ul>

Sensor Display	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.
Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights
